Quarkonium at Belle II

Wednesday 4 May 2022 09:00 (20 minutes)

The Belle II experiment at the SuperKEKB energy-asymmetric e^+e^- collider is an upgrade of the B factory facility at KEK in Tsukuba, Japan. The experiment began operation in 2019 and aims to record a factor of 50 times more data than its predecessor. Belle II is uniquely capable of studying the so-called “XYZ” particles: heavy exotic hadrons consisting of more than three quarks. First discovered by Belle, these now number in the dozens, and represent the emergence of a new category within quantum chromodynamics. We present recent results in new Belle II data, and the future prospects to explore both exotic and conventional quarkonium physics.

Submitted on behalf of a Collaboration?

Yes

Authors: LIBBY, James (Indian Institute of Technology Madras (IN)); LAUTENBACH, Klemens (CPPM)

Presenter: LAUTENBACH, Klemens (CPPM)

Session Classification: WG4: QCD with Heavy Flavours and Hadronic Final States

Track Classification: WG4: QCD with Heavy Flavours and Hadronic Final States
