ScienceMesh - Invitation Workflow Implementation

Monday 24 January 2022 15:30 (10 minutes)

The Invitation workflow is one of the elementary scenarios on how to enable file sharing among users from different EFSS systems. Invitation workflow eliminates the necessity of knowing the exact identity of the user (share receiver) in the target EFSS system. You can generate a share invitation and distribute it via email or distribute the link via any other channel, chat app, etc. The target user then clicks on the link, selects his “home” EFSS, and log in. Once the incoming sharing is accepted the user can see all shared files in his “home” EFSS.
