

# HIGGS COUPLINGS TO FERMIONS

Tao Han  
PITT PACC  
University of Pittsburgh

# THE HIGGS MAGIC

$m_H = 125.38 \pm 0.14 \text{ GeV}$  PLB 805 (2020) 135425

## The Standard Model – first time ever!

- Quantum mechanical
- Relativistic
- Renormalizable
- Perturbatively unitary to exponentially high scales, perhaps to the Planck scale!

All known physics

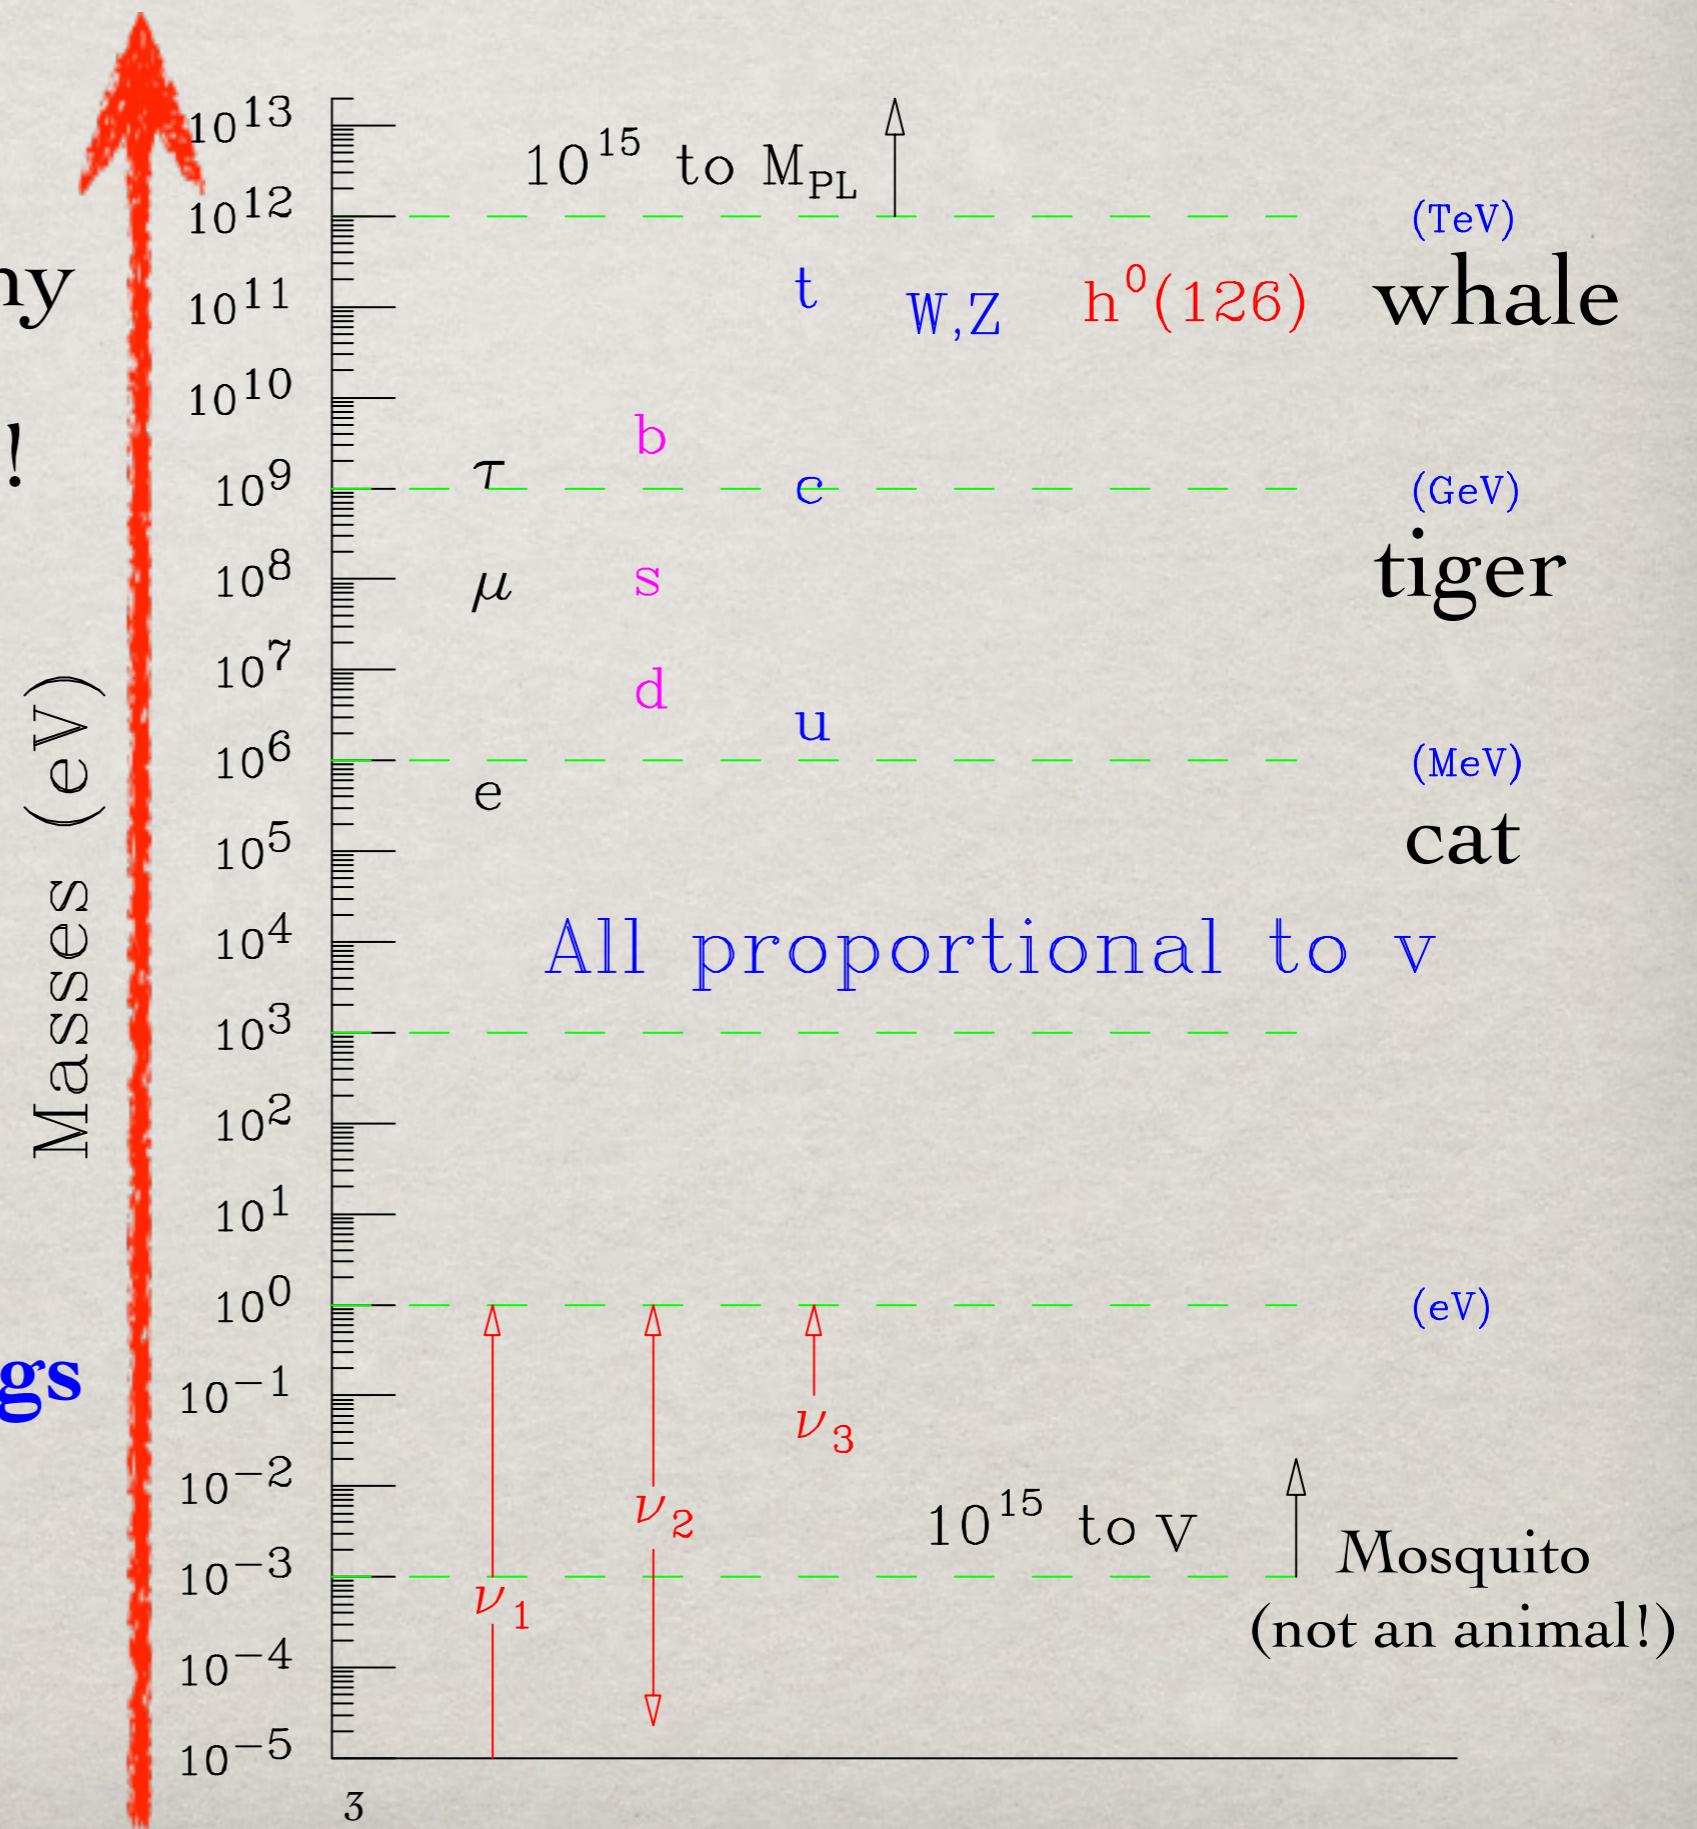

$$W = \int_{k < \Lambda} [\mathcal{D}g \dots] \exp \left\{ \frac{i}{\hbar} \int d^4x \sqrt{-g} \left[ \frac{1}{16\pi G} R - \frac{1}{4} F^2 + \bar{\psi} i \not{D} \psi - \lambda \phi \bar{\psi} \psi + |D\phi|^2 - V(\phi) \right] \right\}$$

# THE HIGGS BLEMISHES

- Particle mass hierarchy
- Tiny neutrino masses!
- Patterns of quark, neutrino mixings
- New CP-violation sources?

Higgs Yukawa couplings  
as the pivot for all !

# THE HIGGS INQUIRIES

In the SM:

$$V(|\Phi|) = -\mu^2 \Phi^\dagger \Phi + \lambda (\Phi^\dagger \Phi)^2$$

$$\langle |\Phi| \rangle = v = (\sqrt{2} G_F)^{-1/2} \approx 246 \text{ GeV}$$

$$m_H \approx 126 \text{ GeV}$$

**M<sub>W,Z</sub> versus m<sub>H</sub> versus m<sub>f</sub>:**

$$(1). M_{W,Z}: M_W^2 W^{\mu+} W_\mu^- (1 + \frac{H}{v})^2 + \frac{1}{2} M_Z^2 Z^\mu Z_\mu (1 + \frac{H}{v})^2$$

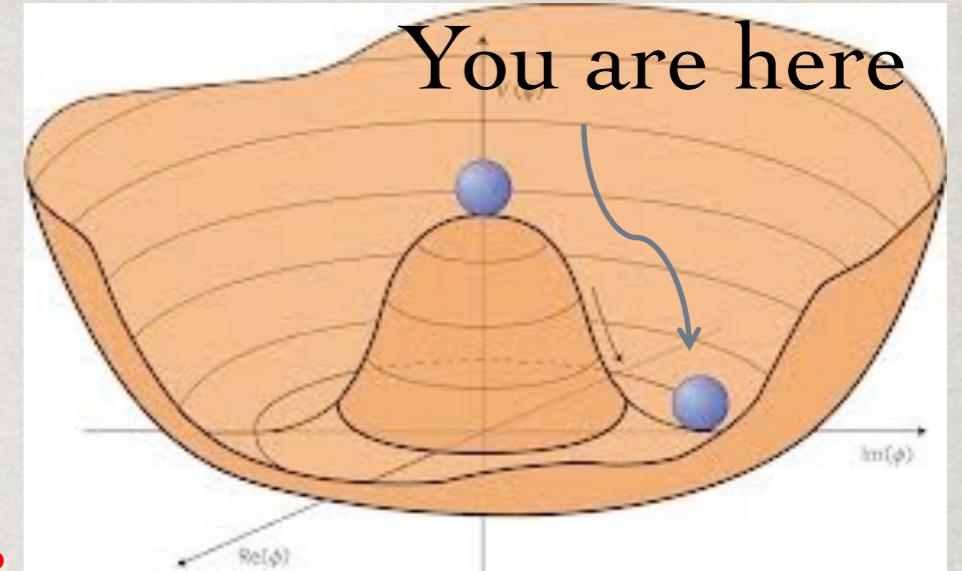

BSM: easy to break SU(2)<sub>L</sub> gauge sector:

- Fundamental scalars (SUSY)
- Dynamical breaking (TC, composite ...)
- Non-linear realization ( $m_H \rightarrow \infty$ , or “Higgsless”)

$$(2). m_H: \frac{1}{2} m_H^2 H^2 + \frac{m_H^2}{2v} H^3 + \frac{m_H^2}{8v^2} H^4$$

BSM: easy to construct a scalar model, but model-parameters quadratically sensitive to a new physics scale:

$$\delta m_H^2 \propto -\frac{k^2}{4\pi^2} \Lambda^2 \quad (M_{\text{SUSY}}^2, M_{\text{comp}}^2, M_{\text{PL}}^2 \dots)$$

# THE HIGGS INQUIRIES

(3).  $m_f$ :  $\mathcal{L}_Y \sim - \sum_{i,j} (Y_{ij}^d \bar{Q}_{iL} \Phi d_{jR} + Y_{ij}^u \bar{Q}_{iL} \tilde{\Phi} u_{jR} + Y_{ij}^e \bar{L}_{iL} \Phi e_{jR} + Y_{ij}^\nu \bar{L}_{iL} \tilde{\Phi} \nu_{jR})$   
In the SM:

$$\mathcal{L}_Y \sim \sum_f m_f \bar{f} f (1 + H/v) \quad Y_f = \frac{\sqrt{2} m_f}{v}$$

- Vastly different hierarchical masses
- Neutrino masses: Dirac vs. Majorana?
- Weak interactions with ad hoc flavor mixings and the CPV phase(s)

Higgs is responsible for our existence!

But is  $Y_e$  fixed by  $m_e$ ? i.e., new physics modification?

$$\text{atomic radius} \propto \frac{1}{m_e}$$

Giulia Zanderighi's talk

# THE HIGGS INQUIRIES

(3).  $m_f$ :  $\mathcal{L}_Y \sim - \sum_{i,j} (Y_{ij}^d \bar{Q}_{iL} \Phi d_{jR} + Y_{ij}^u \bar{Q}_{iL} \tilde{\Phi} u_{jR} + Y_{ij}^e \bar{L}_{iL} \Phi e_{jR} + Y_{ij}^\nu \bar{L}_{iL} \tilde{\Phi} \nu_{jR})$   
In the SM:

$$\mathcal{L}_Y \sim \sum_f m_f \bar{f} f (1 + H/v) \quad Y_f = \frac{\sqrt{2} m_f}{v}$$

BSM: much harder to accommodate

- Generate multiple mass scales
- Avoid FCNC
- Avoid Excessive CPV

$\tilde{Q}$ 's:

- Minimal Flavor Violation?  
Why the flavor mixing aligned with  
the SM Yukawa form?

Exploring flavor physics is complementary & rewarding,

Measuring Higgs Yukawa couplings is indispensable:

**The smaller the coupling is, the more sensitive to deviations!**

# THE HIGGS PURSUITS

Seeking for deviations from the SM:  $\kappa_f = \frac{Y_f}{Y_f^{\text{SM}}}$

- 2HDM:  $\kappa_{u,d} = \frac{\cos \alpha}{\sin \beta}, \frac{\sin \alpha}{\cos \beta}$  (Type I, II, L, ...)

G.C. Branco et al., arXiv:1106.0034.

Other extensions, See talks by Ian Lewis, Heidi Rzehak, Tania Robins ...

- SMEFT: a linear representation:

$$\mathcal{L}_Y \sim \sum_{n=0} \frac{Y_{ij}^n}{\Lambda^{2n}} (\Phi^\dagger \Phi)^n \bar{L}_{iL} \Phi e_{jR} \rightarrow \delta \kappa_f \sim Y_1 \frac{v^2}{\Lambda^2} \sim O(\text{a few \%}) \text{ the target!}$$

and perhaps flavor changing  $H \rightarrow \mu \tau$  ! TH, D. Marfatia, PRL 86, 1442 (2001);  
new CPv phases in Yukawa ... Harnik, Kopp, Zupan, arXiv:1209.1397.

- HEFT: a non-linear representation:

$$U = e^{i\phi^a \tau_a/v} \quad \text{with} \quad \phi^a \tau_a = \sqrt{2} \begin{pmatrix} \frac{\phi^0}{\sqrt{2}} & \phi^+ \\ \phi^- & -\frac{\phi^0}{\sqrt{2}} \end{pmatrix} \quad L_Y \sim -\frac{v}{2\sqrt{2}} \left[ \sum_{n \geq 0} \textcolor{blue}{y_n} \left( \frac{H}{v} \right)^n (\bar{\nu}_L, \bar{\mu}_L) U (1 - \tau_3) \begin{pmatrix} \nu_R \\ \mu_R \end{pmatrix} + \text{h.c.} \right]$$

The scale is at  $\Lambda \sim 4\pi v$  ← close by  
the deviation can be sizable:

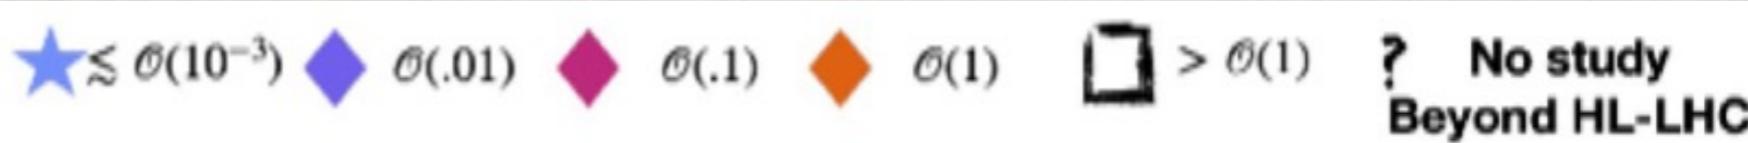

$$\rightarrow \delta \kappa_f \sim Y_1 \frac{H}{v} \sim O(1)$$

# THE HIGGS PURSUITS

$H\bar{f}f$  couplings :

Much work has been done, many great talks,  
I will discuss some ideas.

## (1). $y_t$ : The most wanted!

The current LHC sensitivity:

$$m_H^2 = m_{H0}^2 - \frac{3}{8\pi^2} y_t^2 \Lambda^2$$

$$\delta\kappa_t = 0.35^{+0.36}_{-0.34} \quad (\text{ATLAS})$$

(G. Di Gregorio, ICHEP 2022)

talks by Giulia Zanderighi; Judith Katzy

Future lepton collider sensitivity:

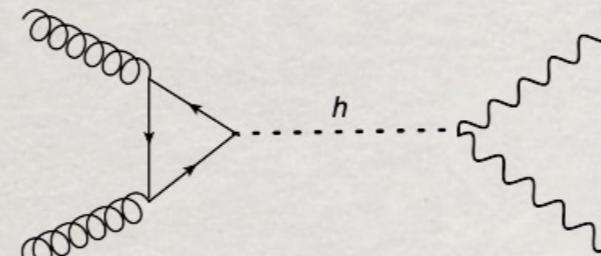

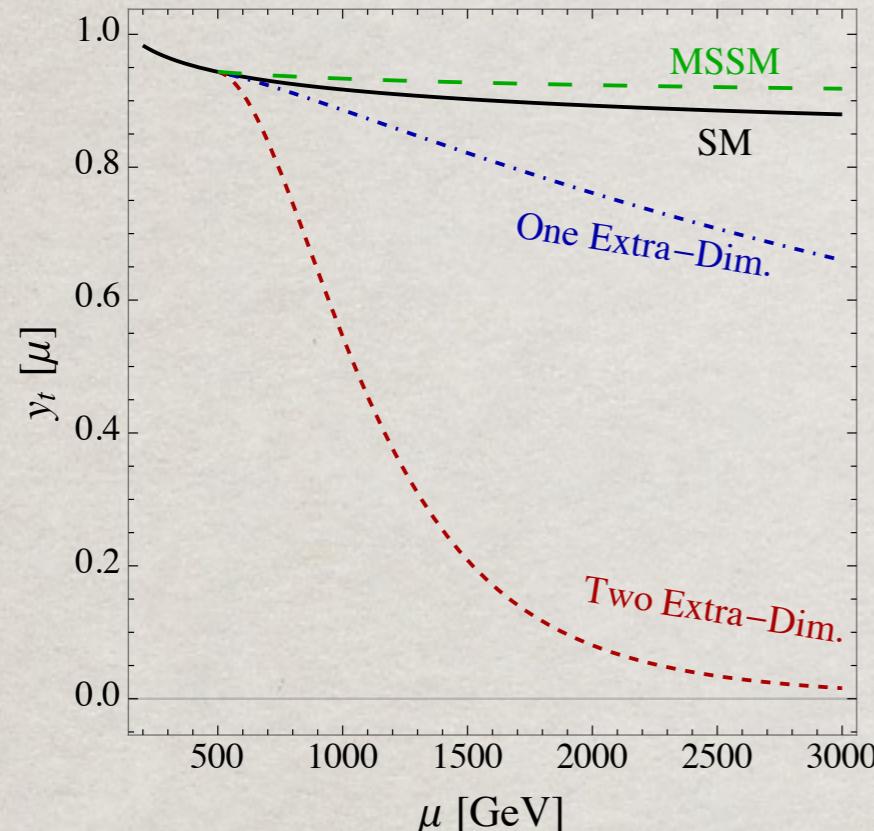

Values in % units		LHC	HL-LHC	ILC500	ILC550	ILC1000	CLIC
$\delta y_t$	Global fit	6.12	2.53	2.08	1.30	0.739	1.48
	Indiv. fit	5.08	1.85	1.80	1.17	0.705	1.26

Table 8: Uncertainties for the top-quark Yukawa coupling at 68% probability for different scenarios, in percentage. The ILC500, ILC550 and CLIC scenarios also include the HL-LHC. The ILC1000 scenario includes also ILC500 and HL-LHC.

EF04 report: <https://arxiv.org/pdf/2209.08078.pdf>

# $t\bar{t}H$ coupling @ high scales:

1. Yukawa  $y_t(Q)$  RGE running: 2. Off-shell probe of EFT operators:

$$\sigma_{\text{on}} \propto \frac{g_i^2(m_h^2)g_f^2(m_h^2)}{m_h\Gamma_h} \quad \text{and} \quad \sigma_{\text{off}} \propto \frac{g_i^2(Q^2)g_f^2(Q^2)}{Q^2}$$

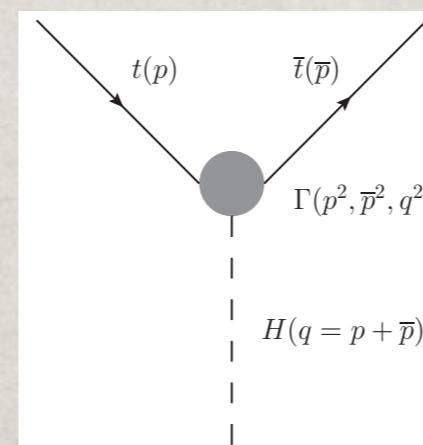

HL-LHC@3 ab<sup>-1</sup> on new physics scale:

	$\Gamma_H/\Gamma_H^{SM}$	$\Lambda_{EFT}$
$H^* \rightarrow ZZ \rightarrow \ell\ell\nu\nu$	1.31	0.8 TeV
$H^* \rightarrow ZZ \rightarrow 4\ell$	1.3 (68% CL) [33]	0.55 TeV [34]

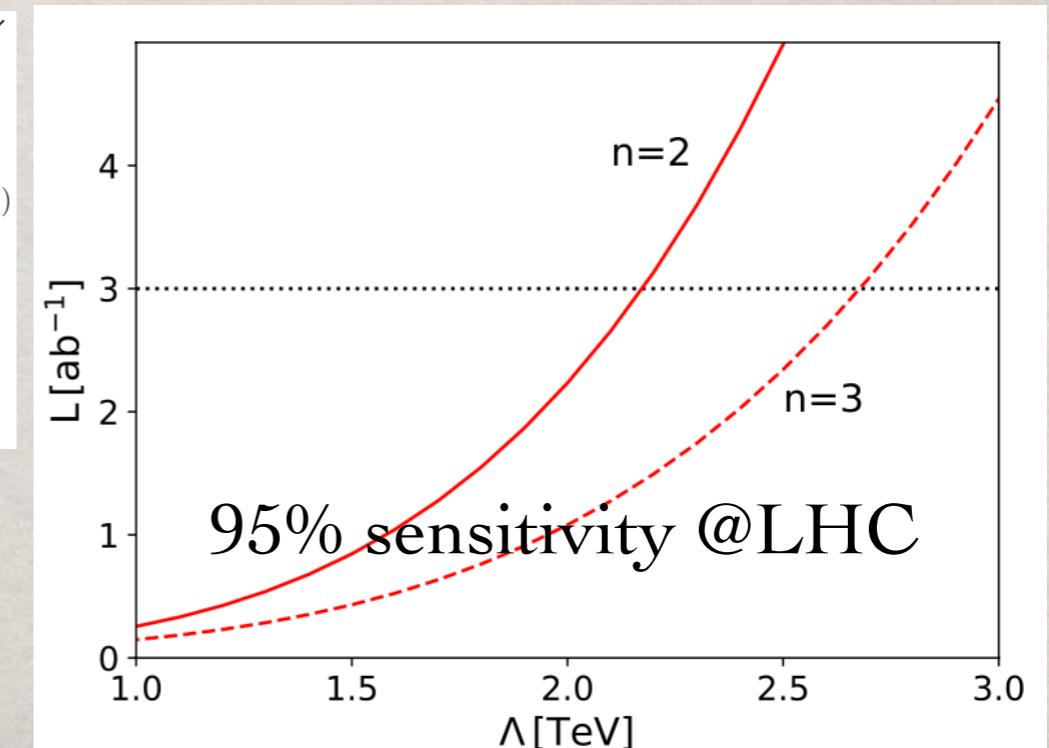

Higgs off-shell: talks by Pascal Vanlaer, Michiel Jan Veen

3. Composite form factors:

$$\Gamma(q^2/\Lambda^2) = \frac{1}{(1 + q^2/\Lambda^2)^n}$$

arXiv:2012.05272.

# THE HIGGS PURSUITS

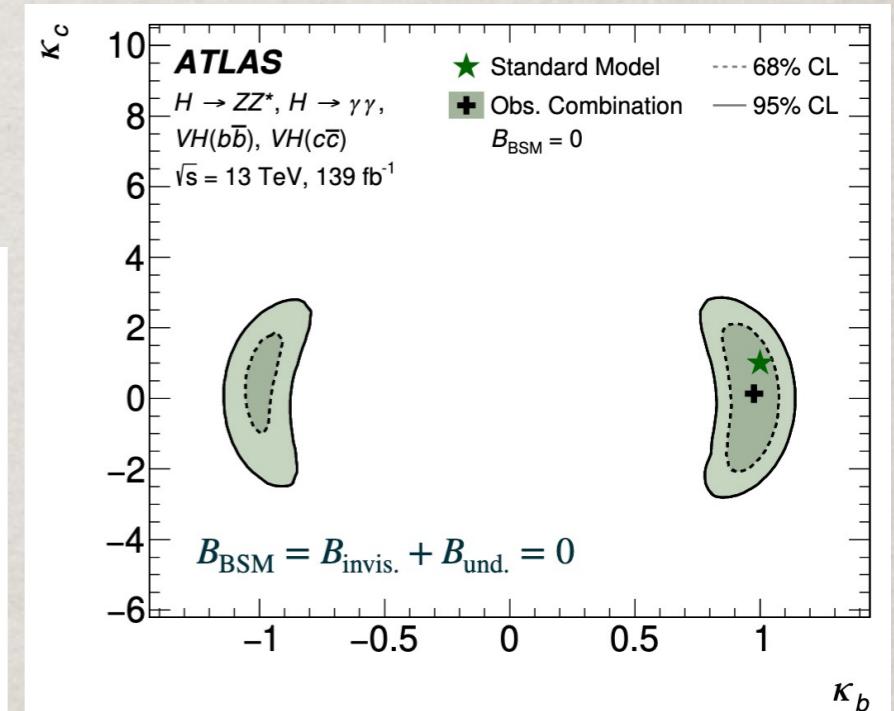

## (2). 2<sup>nd</sup> generation $y_c$ : The real challenge!

The current LHC sensitivity:  $BR_{H \rightarrow c\bar{c}}^{\text{SM}} = (2.88^{+0.16}_{-0.06})\%$

LHC Run 2: ATLAS  $\kappa_c \leq 8.5$  [2201.11428], CMS  $1.1 < |\kappa_c| < 5.5$  [2205.05550]

Adding the VH(cc) and VH(bb) datasets  
**Miha Muškinja** Submitted to JHEP [2207.08615]

Scenario	Upper limit on $\kappa_c$ of 4.8×SM at 95% CL	
	Observed 68% confidence interval	Observed 95% confidence interval
$B_{\text{BSM}} = 0$	[-1.61, 1.70]	[-2.47, 2.53]
No assumption	[-2.63, 3.01]	[-4.46, 4.81]

HL-LHC sensitivity projection: a factor of few from SM

Future HL-LHC:  $\kappa_c \leq 3.$  [2201.11428]

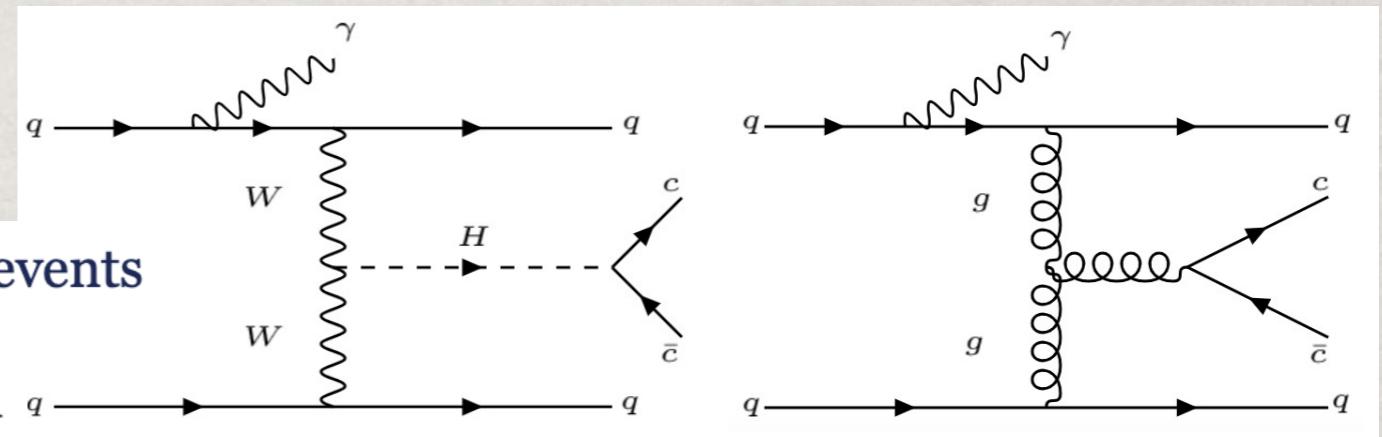

EF01/02 report: <https://arxiv.org/pdf/2209.07510.pdf>

Hbb, Hcc: talks by Susan Dittmer, Alessandro Calandri;  
 Marco Stamenkovic, Miha Muskinja

# THE HIGGS PURSUITS

Higgs production rate is high: #H@LHC  $\sim 50 \text{ M /ab}$  !  
Need new ideas!

- VBF  $\rightarrow H + \gamma$ :

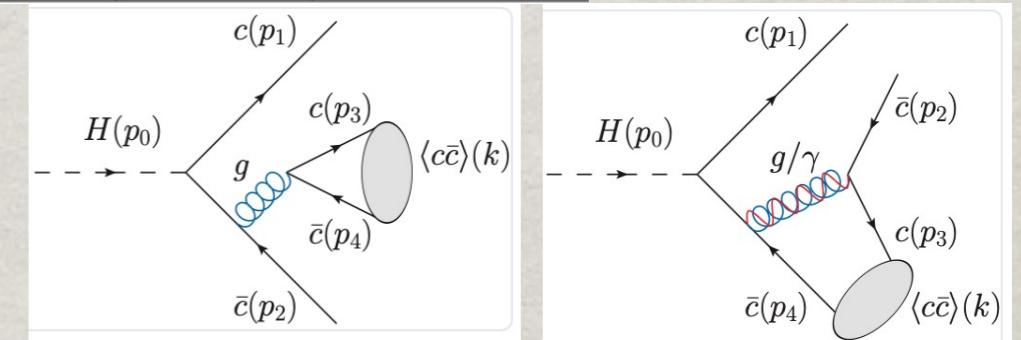

- Striking signatures and sizable signal events
- Extra handle to trigger on
- Suppression of gluon-rich background

B. Carlson, TH, I. Leung, aXive:2105.08738

- Upper bound on  $\kappa_c$  at 95% C.L in absence of systematics:

	LHC	Cut-based	BDT	ZH [16, 17]	Fit [33]	Hc [31]	$H \rightarrow c\bar{c}\gamma$ [41]
$\kappa_c$	$36.1 \text{ fb}^{-1}$	20	16	10	-	-	-
	$3 \text{ ab}^{-1}$	6.5	5.4	2.5	1.2	2.6 - 3.9	8.6

- $H \rightarrow J/\psi$  via fragmentation:
  - Enhanced from the fragmentation
  - Direct coupling to charm

TH, A. Leibovich, Y. Ma, X.Z. Tan: aXive:2202.08273 (and talk by Ma)

$$\text{BR}(H \rightarrow c\bar{c} + J/\psi) = (2.0 \pm 0.5) \times 10^{-5}$$

$$\text{BR}(H \rightarrow c\bar{c} + \eta_c) = (6.0 \pm 1.0) \times 10^{-5}$$

Note:  $\text{BR}(H \rightarrow J/\psi + \gamma) = 2.8 \times 10^{-6}$

➢ Dominated by VMD

Hcc: talks by Alessandro Calandri; Marco Stamenkovic

# THE HIGGS PURSUITS

## (3). 2<sup>nd</sup> generation $Y_\mu$ : The next hope!

The current LHC sensitivity:

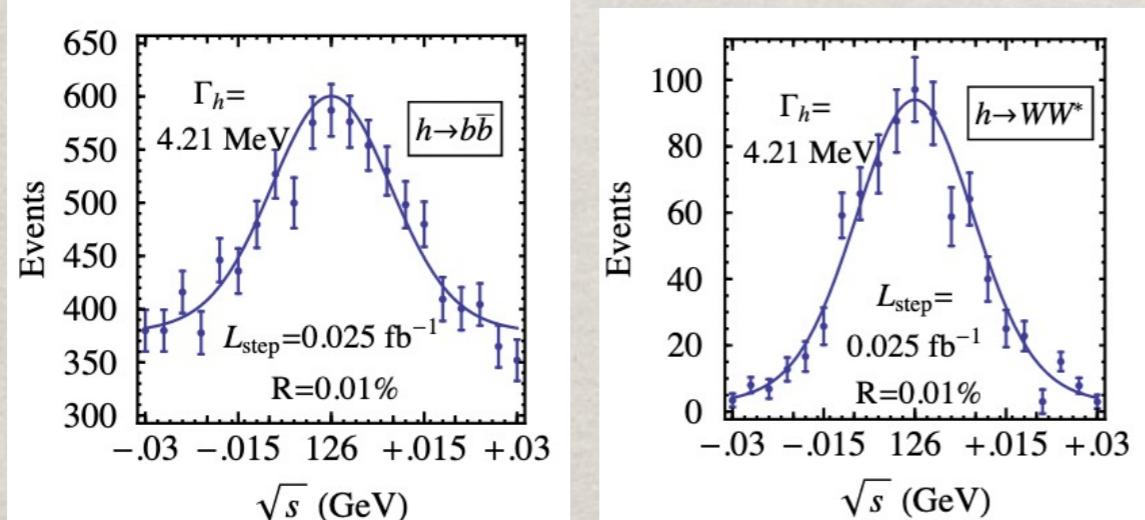

$$BR_{H \rightarrow \mu^+ \mu^-}^{\text{SM}} = (2.17 \pm 0.04) \times 10^{-4}$$

Observation: ATLAS:  $2.0\sigma$ ; CMS  $3.0\sigma$

Talk by Stefano Rosati, P. Lenzi

HL-LHC sensitivity projection:  $\text{BR}(H \rightarrow \mu\mu) < 10\%$   
(assuming the SM width)

Model-independent measurement  
at a muon Higgs factory:

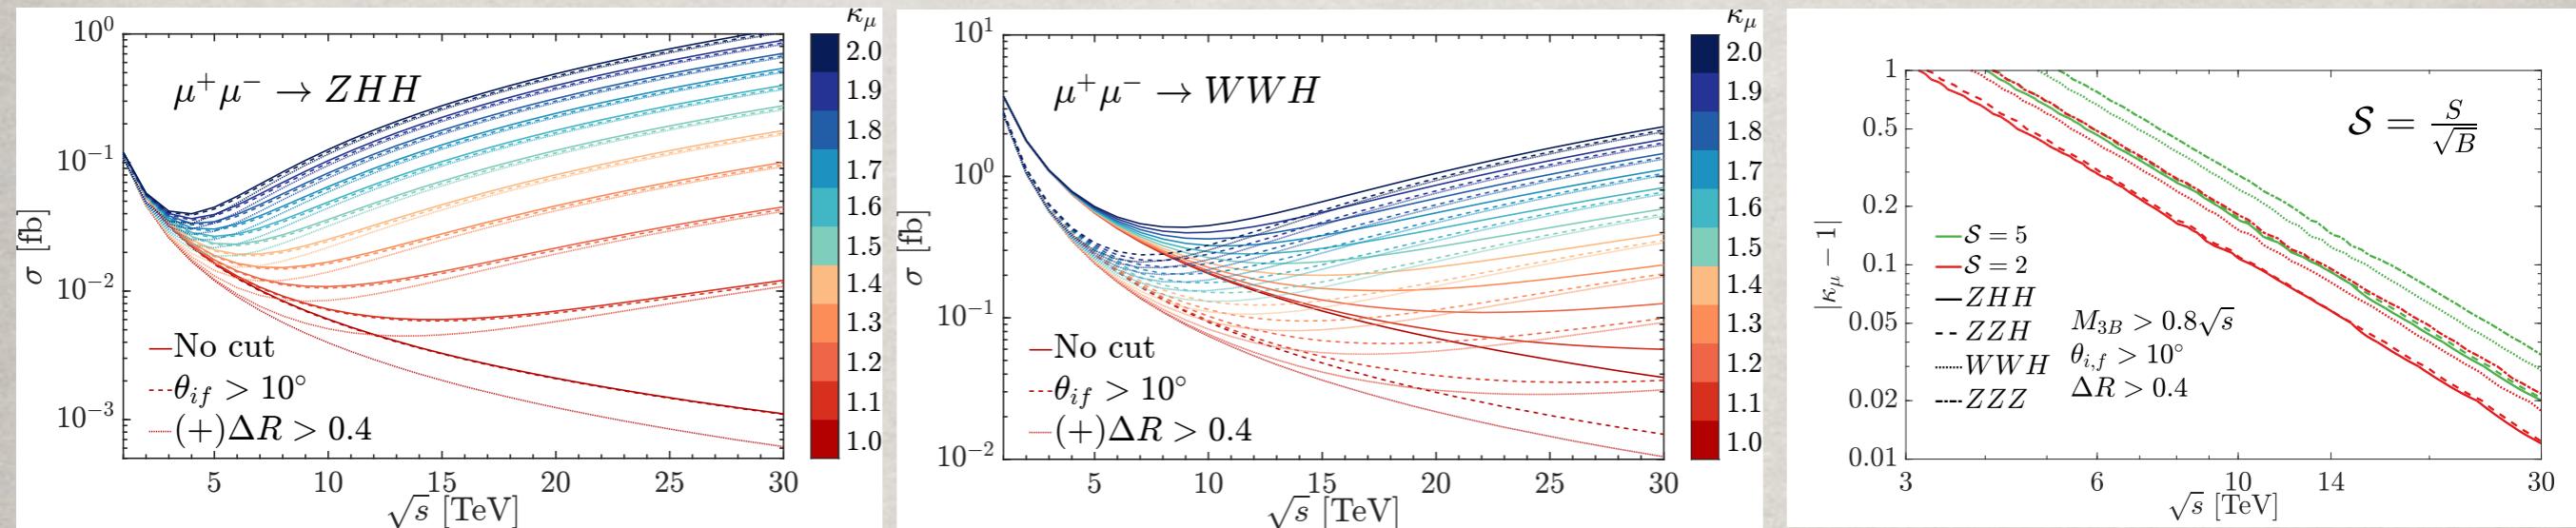

$\Gamma_h$ (MeV)	$L_{\text{step}}$ ( $\text{fb}^{-1}$ )	$\delta\Gamma_h$ (MeV)	$\delta B$	$\delta m_h$ (MeV)
$R = 0.01\%$	0.005	0.73	6.5%	0.25
	<b>0.025</b>	<b>0.35</b>	<b>3.0%</b>	<b>0.12</b>
	0.2	0.17	1.1%	0.06

## Model-independent measurement off the resonance: High energy option

- To enhance the Yukawa coupling effects, multiple Higgs/Goldstone boson production more beneficial.
- Due to the energy-dependence, higher energy collider preferred.

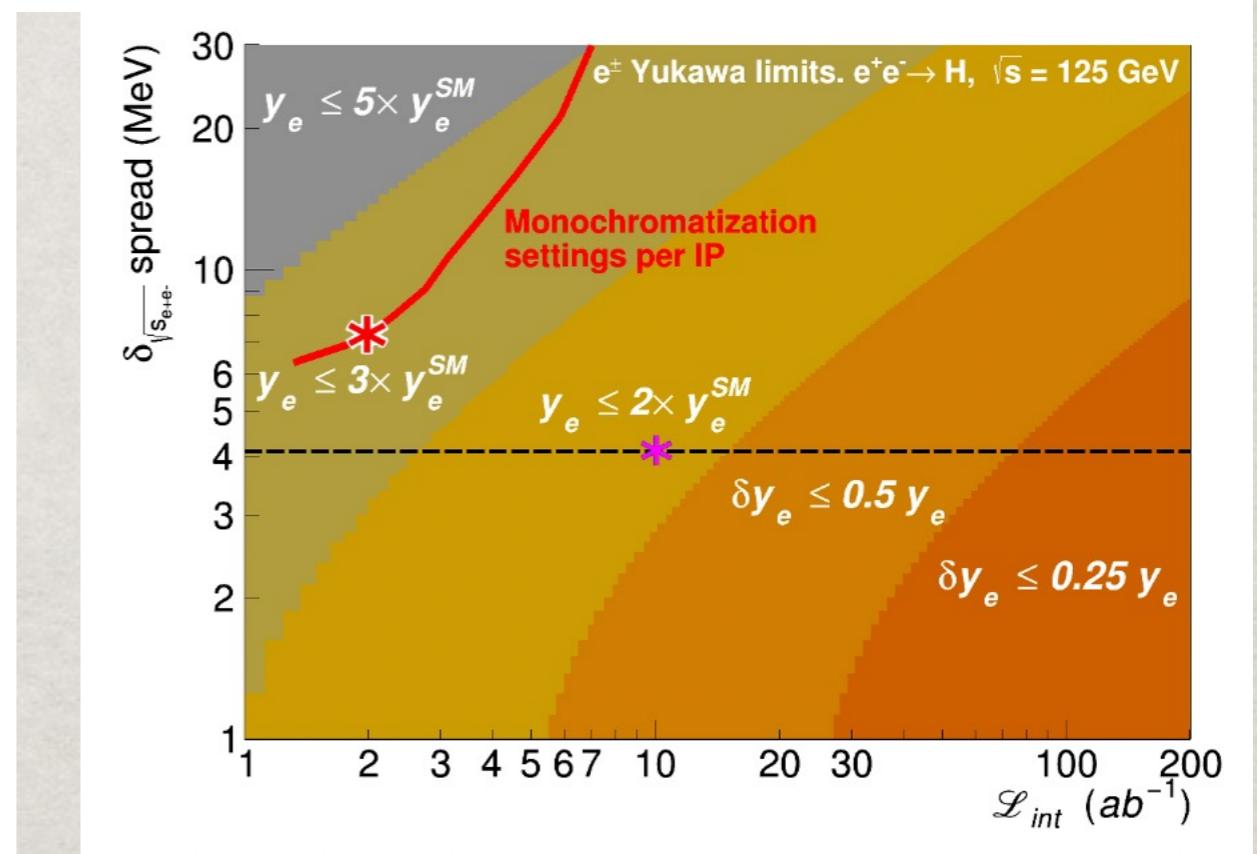

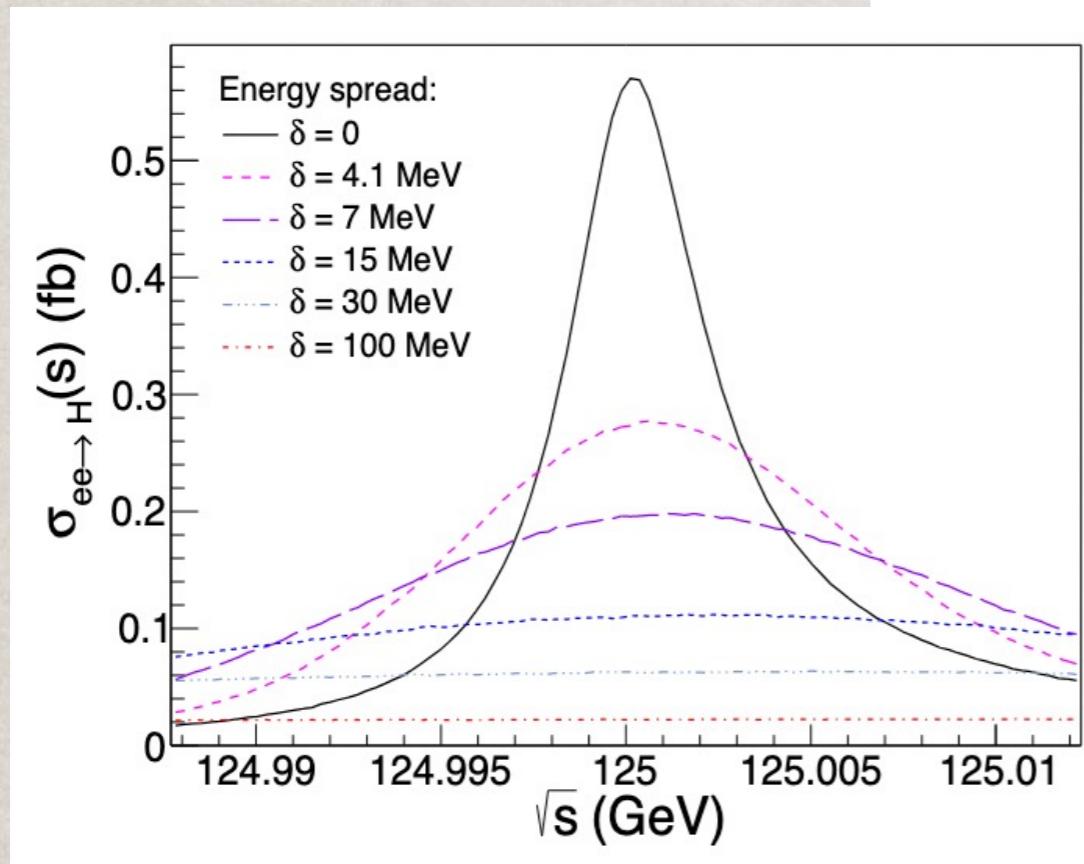

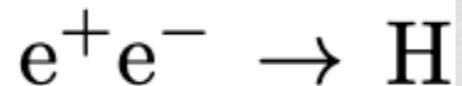

At 30 TeV:  $\delta\kappa_\mu \sim 1\% - 4\%$ , corresponding to  $\Lambda \sim 30 \text{ TeV} - 100 \text{ TeV}$ .

TH, W. Kilian, N. Kreher, Y. Ma, J. Reuter, T. Striegl, K. Xie: <https://arxiv.org/abs/2108.05362>;  
E. Celada, TH, W. Kilian, N. Kreher, Y. Ma, F. Maltoni, D. Pagani, J. Reuter, T. Striegl, K. Xie; to appear.

# THE HIGGS PURSUITS

(4). 1<sup>st</sup> generation  $y_e$ : There is a chance!

$$y_e = \sqrt{2}m_e/v = 2.9 \times 10^{-6}$$

M. Greco, TH, Z. Liu:  
<https://arxiv.org/abs/1607.03210>

Accel. Frontier report:  
<https://arxiv.org/pdf/2203.06520.pdf>

# Conclusions:

- The fermion sector involves multiple scales; numerous mixing parameters, CP phase(s)  
→ rich physics, but least predictive!
- Exploring flavor physics is complementary & rewarding, measuring Higgs Yukawa couplings is indispensable
- SMEFT sets a target:  $\delta\kappa_f \sim Y_1 \frac{v^2}{\Lambda^2} \sim O(\text{a few}\%)$
- HEFT could be nearly:  $\delta\kappa_f \sim Y_1 \frac{H}{v} \sim O(1)$
- Many well-motivated models lead to characteristic signatures to look for:  
flavor violating decays, invisible decays,  
more Higgses, neutrino connection ...

**More work to do & lots of fun!**
