Lógica (“formal” e “da batata”)

Ou como decidir que experiências fazer.

Wason selection task

- “You are shown a set of four cards placed on a table, each of which has a number on one side and a colored patch on the other side. The visible faces of the cards show 3, 8, red and brown. **Which card(s) must you turn over in order to test the truth of the proposition that if a card shows an even number on one face, then its opposite face is red?”**

Wason selection task

- “Há quatro cartas na mesa, cada uma com um número num lado e uma cor no outro. Podemos ver um 3, um 8, uma vermelha, e uma castanha. **Que carta(s) têm que ser viradas de forma a testar a veracidade da proposição que se uma carta tem um número par de um lado, então a cor do outro lado é vermelho?”**”

Trocado por miúdos

- Como testar a ideia que “**par** \Rightarrow **vermelho**”?

Lógica (formal)

- $A \Rightarrow B$
- Ou seja:
par \Rightarrow vermelho

Lógica (formal)

- $A \Rightarrow B \Leftrightarrow \neg B \Rightarrow \neg A$.
- Ou seja:
par \Rightarrow vermelho \Leftrightarrow não-vermelho \Rightarrow não-par.

Lógica (da batata)

□ $\text{par} \Rightarrow \text{vermelho}$

\Leftrightarrow

$\text{não-vermelho} \Rightarrow \text{não-par.}$

□ O que é que a regra implica para cada uma das cartas?

31

Exactidão e precisão

Erro e incerteza

Two words on *accuracy and precision*

Imprecise

Imprecise

Accurate

Inaccurate

37

Erros não são incertezas

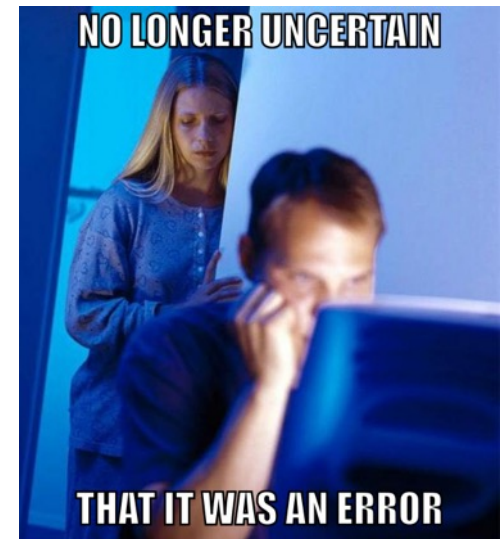

Two words on *error and uncertainty*

38

- **Error:** the result of a **bias** or **mistake**.
- **Uncertainty:** the degree to which some thing is not known.

- ***It's a mistake to call errors uncertainties.***
- E.g., experimentalists correct for systematic effects (biases).
 - ▣ Corrections come with added uncertainty.

An offer you can't refuse

- I sent you correct buy/sell stock predictions every week for the last 10 weeks.

An offer you can't refuse

- I sent you correct buy/sell stock predictions every week for the last 10 weeks.
 - ▣ What's the probability of that happening by chance?

An offer you can't refuse

- I sent you correct buy/sell stock predictions every week for the last 10 weeks.
 - ▣ What's the probability of that happening at random?

- Surely you should send me \$1000 to invest for you.
 - ▣ **Right?**

An offer you can't refuse

- I sent you correct buy/sell stock predictions every week for the last 10 weeks.
 - ▣ What's the probability of that happening at random?

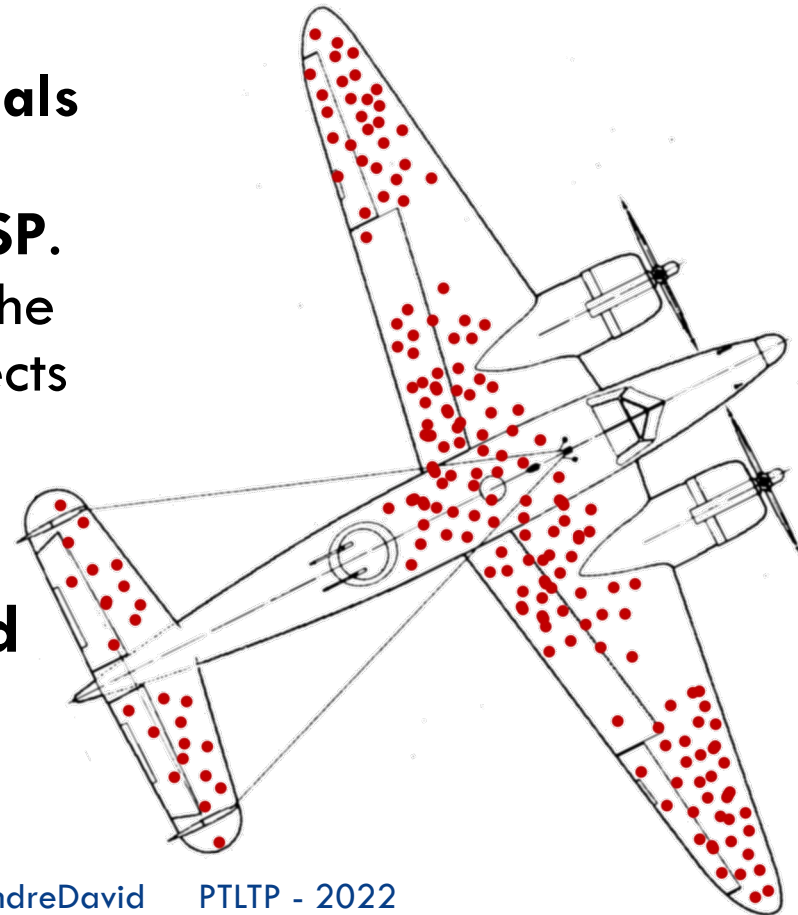

- Surely you should send me \$1000 to invest for you.
 - ▣ **Right?**

What is the denominator/context?

- Survivorship bias.
 - “the parapsychology researcher Joseph Banks Rhine **believed he had identified the few individuals from hundreds of potential subjects who had powers of ESP.** His calculations were based on the improbability of these few subjects guessing”

- **Important when reporting and story-telling.**

You can't unsee it

You can't unsee it

Theorists may see the next wave.

Experimentalists surf it.

Electromagnetic force – light

Weak force – star combustion

Strong force – protons and neutrons

How SM Higgses are born

□ **Gluon fusion**

□ **VBF**

□ **WH, ZH**

□ **bbH, ttH**

How SM Higgses die

- Couplings and kinematics drive BR ($b\bar{b}$, WW , $\tau\tau$, ZZ).
- Decays with photons ($\gamma\gamma$, $Z\gamma$) through loops.

Near to maximal $\Gamma\text{BR}_i \rightarrow$

Putting it all together

Looking up to a new boson

82

[<http://cern.ch/go/q8jx>]

Higgsdependence day recap

- **Both experiments at 5.0σ .**
 - One above SM expectations...
 $\sigma_{\text{ATLAS}}/\sigma_{\text{SM}} = 1.2 \pm 0.3$ (at 126.5 GeV).
 - ...the other one below.
 $\sigma_{\text{CMS}}/\sigma_{\text{SM}} = 0.80 \pm 0.20$ (at 125 GeV).
- Mass
 - ATLAS: min. p-value at 126.5 GeV.
 - CMS: $m_\chi = 125.3 \pm 0.6$ GeV.
- “Proto-couplings” compatible with SM.
- **“More data needed...”**

THE CANDIDATES

The Higgs Boson

By Jeffrey Kluger | Monday, Nov. 26, 2012

◀ 18 of 40 ▶

SSPL/GETTY IMAGES

Simulation of a Higgs-Boson decaying into four muons, CERN, 1990.

What do you think?

Should **The Higgs Boson** be TIME's Person of the Year 2012?

Definitely No Way

VOTE

Take a moment to thank this little particle for all the work it does, because without it, you'd be just inchoate energy without so much as a bit of mass. What's more, the same would be true for the entire universe. It was in the 1960s that Scottish physicist Peter Higgs first posited the existence of a particle that causes energy to make the jump to matter. But it was not until last summer that a team of researchers at Europe's Large Hadron Collider — Rolf Heuer, Joseph Incandela and Fabiola Gianotti — at last sealed the deal and in so doing finally fully confirmed Einstein's general theory of relativity. The Higgs — as particles do — immediately decayed to more-fundamental particles, but the scientists would surely be happy to collect any honors or awards in its stead.

Combined LHC mass measurement

Combined LHC mass measurement

[arXiv:1503.07589]

$$m_H = 125.09 \pm 0.21 \text{ (stat)}$$

$$\pm 0.11 \text{ (scale)}$$

$$\pm 0.02 \text{ (other)}$$

$$\pm 0.01 \text{ (theory*)}$$

**Stat. uncertainty
dominates overall.**

**Energy scale syst. can
be improved.**

Run 2 will reduce
uncertainty !

GeV

98

For the record

- ~5150 authors.
- Found that there are two:
 - Archana Sharma
(both CMS)
 - Andrea Bocci
 - Muhammad Ahmad
 - F. M. Giorgi
(one CMS, one ATLAS)

Physics paper sets record with more than 5,000 authors

Detector teams at the Large Hadron Collider collaborated for a more precise estimate of the size of the Higgs boson.

Daive Castelvechi

15 May 2015

CERN

Thousands of scientists and engineers have worked on the Large Hadron Collider at CERN.

A physics paper with 5,154 authors has — as far as anyone knows — broken the record for the largest number of contributors to a single research article.

750 GeV diphoton excess

From Wikipedia, the free encyclopedia

The **750 GeV diphoton excess** in [particle physics](#) was an anomaly in data collected at the [Large Hadron Collider](#) (LHC) in 2015, which could have been an indication of a new particle or [resonance](#).^{[8][9]} The anomaly was absent in data collected in 2016, suggesting that the diphoton excess was a statistical fluctuation.^{[1][2]} In the interval between the December 2015 and August 2016 results, the anomaly generated considerable interest in the scientific community, including about 500 theoretical studies.^[10] The hypothetical particle was denoted by the [Greek letter F](#) (pronounced digamma) in the scientific literature, owing to the decay channel in which the anomaly occurred.^[3] The data, however, were always less than five [standard deviations](#) (sigma) different from that expected if there was no new particle, and, as such, the anomaly never reached the accepted level of [statistical significance](#) required to announce a discovery in particle physics.^[11] The digamma was refuted in August 2016 publications.

December 2015 data [edit]

On December 15, 2015, the [ATLAS](#) and [CMS](#) collaborations at [CERN](#) presented results from the second operational run of the [Large Hadron Collider](#) (LHC) at the [center of mass](#) energy of 13 TeV, the highest ever achieved in proton-proton collisions. Among the results, the [invariant mass](#) distribution of pairs of high-energy photons produced in the collisions showed an excess of events compared to the [Standard Model](#) prediction at around 750 GeV/c². The [statistical significance](#) of the deviation was reported to be 3.9 and 3.4 [standard deviations](#) (locally) respectively for each experiment.

The excess could have been explained by the production of a new particle (the digamma) with a mass of about 750 GeV/c² that decayed into two photons. The [cross-section](#) at 13 TeV centre of mass energy required to explain the excess, multiplied by the [branching fraction](#) into two photons, was estimated to be

$$\sigma(pp \rightarrow F) \times \text{Br}(F \rightarrow \gamma\gamma) \approx 5 \text{ fb}$$

(fb=femtobarns)

This result, while unexpected, was compatible with previous experiments, and in particular with the LHC measurements at a lower centre of mass energy of 8 TeV.

August 2016 data [edit]

Analysis of a larger sample of data, collected by ATLAS and CMS in the first half 2016, did not confirm the existence of the [F](#) particle, which indicates that the excess seen in 2015 was a statistical fluctuation.^{[1][2]}

Digamma

Possible production and decay mechanism of the digamma resonance at LHC.
