

Da física de altas energias a aplicações médicas

Jose C. da Silva

08/09/2022

PTLTP22, CERN, CH

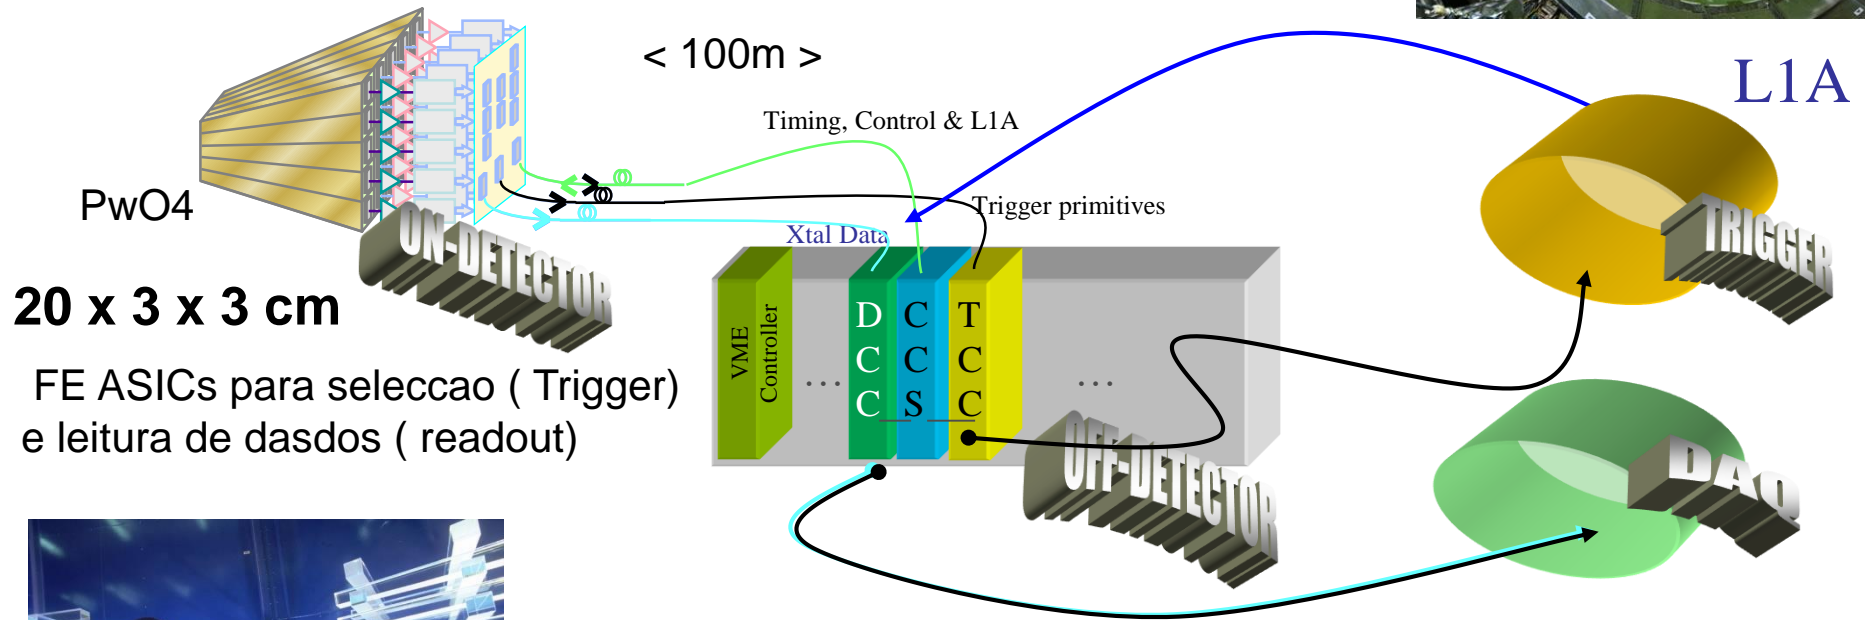

Da Física de Partículas ...

Exemplo ECAL :

~76000 sensores
Modulo 68 sensores

PwO4

Electron and photon detection

Parameter	Barrel	Endcaps
# of crystals	61200	14648
Volume	8.14m ³	2.7m ³
Xtal mass (t)	67.4	22.0

Objetivo: Medir a energia dos fótons vindos do decaimento do bosão de Higgs com precisão de 0.5%

Fótons de alta energia o LHC

- 50.000 Milhões de vezes mais energéticos que os do sol
- γ (gamma)

Cristais: absorve gamma; converte-os energia em Luz

APD/SIPM : convertem luz em sinal elétrico

Exemplo CLEAR PEM :

6144 canais
Modulo 32 sensores

ASIC de leitura com alta qualidade de medida temporal

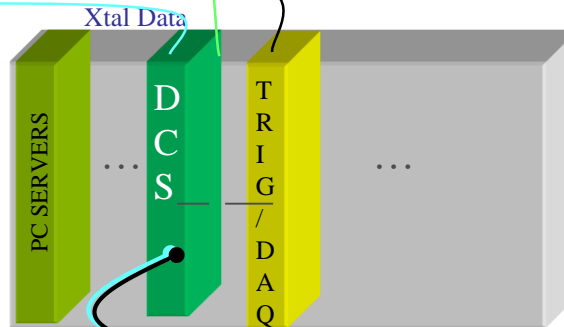

Software de reconstrução

LYSO

20 x 3 x 3 mm

160MHz

Positron Emission Tomography

**PET scanner =
ring of detectors**

Gammas em PET são 200 vezes mais energéticos que os da luz visível

Tecnologia de
imagiologia para
detecção de cancro

- o paciente recebe uma droga com um istotopo de emissão de positrões
- Os positrões aniquilam-se emitindo dos **gamma em sentidos opostos**
- PET scanner e' geralmente um anel de detectores
- Dois detectores opostos definem um linha
- Uma grande quantidade dessas deteções permitem uma reconstrução espacial em 3D da dispersão da droga

To build an high performance detector for breast cancer detection with unprecedented resolution

- 6 years of I&D
- 6 M€ funding

Supported by:

Crystals LYSO:

- Density: $7.4\text{g}\cdot\text{cm}^{-3}$
- Emission Peak: 420nm

Avalanche Photodiodes (APD): Hamamatsu S8550

- Gain ~ 150
- Dark Current: $\leq 10\text{nA} / \text{pixel}$

Basic detector module : a Supermodule

- PET ASICs
- 12 x32 crystals
- 2 x 192 ch ASIC Readout per side
- Dual readout of the xtal matrices
- Low power, low noise
-

Modular compact system

- Blocs of detection units
 - 16 Supermodules
 - 2 detection units
 - PSU
 - Clock & Control
 - HV
 - DAQ system

Da Modelização à Realização

The full project , from electronics to mechanics, was first emulated with 3D CAD/CAE systems , and manufactured only after.

1. Water cooling plates

2. Supermodulos

3. connexion panel)

4. Cables assembly

5 : Service Board (LV , HV, CLOCK, DATA)

6. HV Matrix (HV distribution)

Detector Heads Final

DAQ and Trigger units

DAQ Board

**New Data link:
S-link 64**

TRG/DCC Board

- The L1 trigger and DAQ boards are assembled in one external crate
- Complex trigger algorithm (36K calibration constants)
- Frontend - L1 Trigger - at 156 Gb/s
- Level 2 DAQ: Servidor high-end
- L1-L2 bandwidth up to 800 MB/s

TRG/DCC Board

4 x DAQ Boards

Level 1 Trigger/DAQ

ClearPEM Images

- Two acquisition per position
- (400-600 keV)
- Simultaneous reconstruction with 16 acquisition points

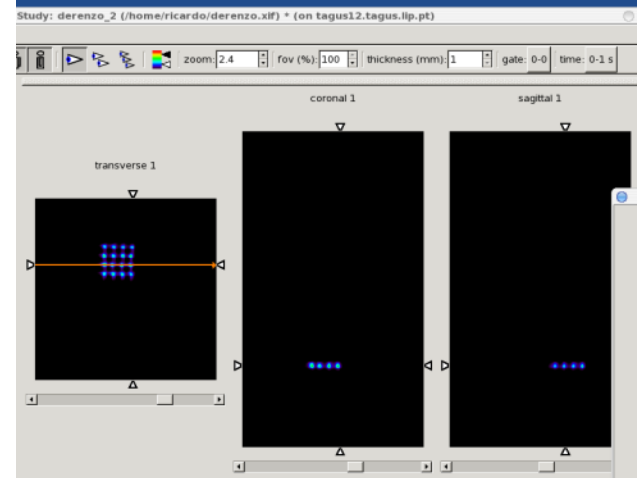

OSEM-3D

OSEM-2D

FWHM (deconvoluted of source size) = 1,2 mm

Grid with 5 mm pitch
1 mm Na-22 source

Development concluded in 2008

- The PET Scanner with the best spacial resolution (1.3mm)
- The only PET in the market with DOI measurement and without paralax
- The highest density of integration

- We have fully developed two PET scanners
 - CLEAR PEM and CLEAR PEM SONIC
- The validity of the results was demonstrated on clinical trials in Coimbra (Portugal) and in the Hopital Nord, in Marseilles (France)
- We have identified several cases of cancers that were invisible in the full body PET scanners.
- Still ongoing:
 - Clinical trials at Hospital San Gerardo, Monza, Italy
 - PET Markers studies (ICNAS, Coimbra)

Patient with breast cancer tumors imaged both with whole-body PET and with ClearPEM

PET/CT exam:
Resolution is insufficient to identify multiple focus

PEM:

- Multifocal Lesions are observed
- Strong impact on surgery planning

Novas tecnologias Novos detectores Novas aplicações

New technologies New detectors New applications

High sensitivity:

- New PET modules with higher sensitivity
- New photodetectors (APDs->SiPM)

PET Time-of-Flight

- New time-of-flight PET detectors, SiPM (Silicon Photomultipliers)
- New ASIC for time-of-flight PET detectors

Trigger/DAQ for large scanner systems

- New DAQ high performance system
 . (for brain abd full body PET)
- New DAQ formats from market(uTCA)
- DAQ goes optical

Better time resolution will dramatically improve the PET image quality

- The accuracy of the source localization depends on the coincidence time resolution (CTR)
- $\Delta x = \text{uncertainty in position along LOR} = (\text{speed of light}) \times \text{CTR}/2$
- The TOF benefit is proportional to $D/\Delta x$
- With PMTs $\text{CTR} \geq 500 \text{ ps}$ if great care is taken to get the best CTR

PETsys Detector Modules have CTR ~250 ps

New Crystal Detector Matrices

Sinocera Matrix

64% packing fraction
82% 511 keV interaction probability
(20 mm crystals)

Proteus Matrix

88% packing fraction
92% 511 keV interaction probability
(30 mm crystals)

Better xtal matrices , with reduced gaps, from a direct interaction with manufacturers

PETsys
Electronics

PET HEAD

Excellent performance

Detector module
based on arrays of
8x8 LYSO pixels of
1.5x15x15 mm

Joint patent PETsys-CERN

The PETsys High Performance TOFPET2 ASIC is a new 64 channel chip for the readout and digitization of signals from fast photon detectors in applications where a high data rate and fast timing is required.

Ext. Clock(MHz)	Bin Width (ps)	Data Rate (Mbit/s)	Event Rate/channel (kHz)
160	50	320	240
200	40	400	300
320	50	640	480
400 ¹	40 ¹	800 ¹	600 ¹

¹ Available for a future version.

Table 1. Clock, resolution and data rate settings available, and relative maximum event rate per channel.

PETsys data acquisition system

- Allows building a PET scanner with several 10'000 channels
- Three large systems are now assembled:
 - PET demonstrator (2048 ch)
 - EndoTOFPET plate (4096 ch)
 - Bruker SA system (6144 ch)
- Operation of these systems is allowing field test and correction of software bugs
- Pushing up the system performance
- Clients are very much attracted by PETsys complete offer (from ASIC to software)

Complete solution from the detector to the data acquisition PC

Technology using SiPMs

TOF-PET from PROTON Therapy

The aim of the project is to demonstrate the feasibility of Positron Emission Tomography (PET) with very good Time of flight (TOF) for range verification in proton radiation therapy.

Partnership with First Sensor

First case: cargo/container scanning

- based on gamma ray radiography
- same detectors as for PET

- Successful technology spin-off:
 - PETsys is now widely known as a supplier of high-performance electronics and detectors based on SiPMs.
- Interplay between CERN, LIP and PETsys has been very useful for all parties
