Roadmap for Neutrino Models

Dirac Neutrino Models

- ▶ Neutrinos may be Dirac particles without lepton number violation
- ▶ Oscillation experiments cannot distinguish Dirac neutrinos from Majorana neutrinos
- ▶ Spin-flip transition rates (early universe, stars) are suppressed by small neutrino mass:

$$\Gamma_{\text{spin-flip}} \approx \left(\frac{m_\nu}{E} \right)^2 \Gamma_{\text{weak}}$$

- ▶ Neutrinoless double beta decay discovery would establish neutrinos to be Majorana particles
- ▶ If neutrinos are Dirac, it would be nice to understand the smallness of their mass
- ▶ Models exist which explain the smallness of Dirac m_ν
- ▶ “Dirac leptogenesis” can explain baryon asymmetry

Dick, Lindner, Ratz, Wright (2000)

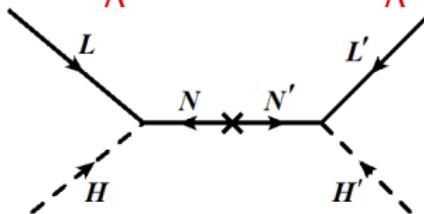

Dirac Seesaw Models

- Dirac seesaw can be achieved in Mirror Models
Lee, Yang (1956); Foot, Volkas (1995); Berezhiani, Mohapatra (1995),
Silagadze(1997)
- Mirror sector is a replica of Standard Model, with new particles transforming under mirror gauge symmetry:

$$L = \begin{pmatrix} \nu \\ e \end{pmatrix}_L ; \quad H = \begin{pmatrix} H^+ \\ H^0 \end{pmatrix} ; \quad L' = \begin{pmatrix} \nu' \\ e' \end{pmatrix}_L ; \quad H' = \begin{pmatrix} H'^+ \\ H'^0 \end{pmatrix}$$

- Effective dimension-5 operator induces small Dirac mass:

$$\frac{(LH)(L'H')}{\Lambda} \Rightarrow m_\nu = \frac{vv'}{\Lambda}$$

- $B - L$ may be gauged to suppress Planck-induced Weinberg operator $(LLHH)/M_{Pl}$ that would make neutrino pseudo-Dirac particle

Dirac Neutrinos from Left-Right Symmetry

- ▶ In left-right symmetric models with a “universal seesaw”, neutrinos are naturally Dirac particles
- ▶ Gauge symmetry is extended to $SU(3)_c \times SU(2)_L \times SU(2)_R \times U(1)_X$
- ▶ These models are motivated on several grounds:
 - ▶ Provide understanding of Parity violation
 - ▶ Better understanding of smallness of Yukawa couplings
 - ▶ Requires right-handed neutrinos to exist
 - ▶ Provide a solution to the strong CP problem via Parity

Davidson, Wali (1987); Babu, He (1989); Babu, Mohapatra (1990); Craig, Garcia Garcia, Koszegi, McCune (2020); Babu, He, Su, Thapa (2022)

Left-Right Symmetry

- Fermion transformation:

$$Q_L (3, 2, 1, 1/3) = \begin{pmatrix} u_L \\ d_L \end{pmatrix}, \quad Q_R (3, 1, 2, 1/3) = \begin{pmatrix} u_R \\ d_R \end{pmatrix},$$

$$\Psi_L (1, 2, 1, -1) = \begin{pmatrix} \nu_L \\ e_L \end{pmatrix}, \quad \Psi_R (1, 1, 2, -1) = \begin{pmatrix} \nu_R \\ e_R \end{pmatrix}.$$

- Vector-like fermions are introduced to realize seesaw for charged fermion masses:

$$P(3, 1, 1, 4/3), \quad N(3, 1, 1, -2/3), \quad E(1, 1, 1, -2).$$

- Higgs sector is very simple:

$$\chi_L (1, 2, 1, 1) = \begin{pmatrix} \chi_L^+ \\ \chi_L^0 \end{pmatrix}, \quad \chi_R (1, 1, 2, 1) = \begin{pmatrix} \chi_R^+ \\ \chi_R^0 \end{pmatrix}$$

- $\langle \chi_R^0 \rangle = \kappa_R$ breaks $SU(2)_R \times U(1)_X$ down to $U(1)_Y$, and $\langle \chi_L^0 \rangle = \kappa_L$ breaks the electroweak symmetry with $\kappa_R \gg \kappa_L$

Seesaw for charged fermions

- Yukaw interactions:

$$\begin{aligned}\mathcal{L} = & y_u (\bar{Q}_L \tilde{\chi}_L + \bar{Q}_R \tilde{\chi}_R) P + y_d (\bar{Q}_L \chi_L + \bar{Q}_R \chi_R) N \\ & + y_\ell (\bar{\Psi}_L \chi_L + \bar{\Psi}_R \chi_R) E + h.c.\end{aligned}$$

- Vector-like fermion masses:

$$\mathcal{L}_{\text{mass}} = M_{P^0} \bar{P}P + M_{N^0} \bar{N}N + M_{E^0} \bar{E}E$$

- Seesaw for charged fermion masses:

$$M_F = \begin{pmatrix} 0 & Y \kappa_L \\ Y^\dagger \kappa_R & M \end{pmatrix} \Rightarrow m_f = \frac{Y^2 \kappa_L \kappa_R}{M}$$

- There is no seesaw for neutrinos, since there is no corresponding singlet fermion
- Dirac neutrino masses arise via two-loop diagrams

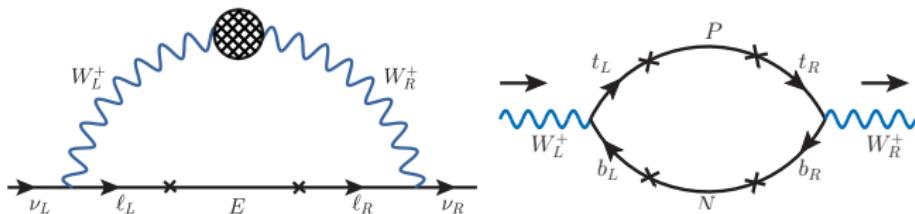

Matter Content from $SU(5)_L \times SU(5)_R$

$$\psi_{L,R} = \begin{bmatrix} D_1^c \\ D_2^c \\ D_3^c \\ e \\ -\nu \end{bmatrix}_{L,R} \quad \chi_{L,R} = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 & U_3^c & -U_2^c & -u_1 & -d_1 \\ -U_3^c & 0 & U_1^c & -u_2 & -d_2 \\ U_2^c & -U_1^c & 0 & -u_3 & -d_3 \\ u_1 & u_2 & u_3 & 0 & -E^c \\ d_1 & d_2 & d_3 & E^c & 0 \end{bmatrix}_{L,R},$$

- ▶ All left-handed SM fermions are in $\{(10, 1) + (\bar{5}, 1)\}$, while all right-handed SM fermions are in $\{(1, 10) + (1, \bar{5})\}$
- ▶ There is ν_R in the theory, but no seesaw for neutrino sector
- ▶ Small Dirac neutrino masses arise as two-loop radiative corrections
- ▶ We have evaluated the flavor structure of the two-loop diagrams and shown consistency with neutrino data

Two-loop Dirac Neutrino Masses

- ▶ Higgs sector is very simple: $\chi_L(1, 2, 1, 1/2) + \chi_R(1, 1, 2, 1/2)$
- ▶ $W_L^+ - W_R^+$ mixing is absent at tree-level in the model
- ▶ $W_L^+ - W_R^+$ mixing induced at loop level, which in turn generates Dirac neutrino mass at two loop Babu, He (1989)

- ▶ Flavor structure of two loop diagram needs to be studied to check consistency
- ▶ Oscillation date fits well within the model regardless of Parity breaking scale Babu, He, Su, Thapa (2022)

Loop Integrals

$$M_{\nu^D} = \frac{-g^4}{2} y_t^2 y_b^2 y_\ell^2 \kappa_L^3 \kappa_R^3 \frac{r M_P M_N M_{E_\ell}}{M_{W_L}^2 M_{W_R}^2} I_{E_\ell}$$

$$I_{E_\ell} = \int \int \frac{d^4 k d^4 p}{(2\pi)^8} \frac{3M_{W_L}^2 M_{W_R}^2 + (p^2 - M_{W_L}^2)(p^2 - M_{W_R}^2)}{k^2(p+k)^2(k^2 - M_N^2)((p+k)^2 - M_\rho^2)p^2(p^2 - M_{E_\ell}^2)(p^2 - M_{W_L}^2)(p^2 - M_{W_R}^2)}$$

$$\begin{aligned}
G_1 = & \frac{3}{(r_3 - 1)(r_4 - 1)(r_4 - r_3)} \left[-\frac{\pi^2}{6}(r_1 + r_2)(r_3 - 1)(r_3 - r_4)(r_4 - 1) \right. \\
& + r_3 r_4 (r_4 - r_3) \left(r_1 F \left[\frac{1}{r_1}, \frac{r_2}{r_1} \right] + r_2 F \left[\frac{1}{r_2}, \frac{r_1}{r_2} \right] + F[r_1, r_2] \right) \\
& - (r_4 - 1)r_4 \left(r_1 F \left[\frac{r_3}{r_1}, \frac{r_2}{r_1} \right] + r_2 F \left[\frac{r_3}{r_2}, \frac{r_1}{r_2} \right] + r_3 F \left[\frac{r_1}{r_3}, \frac{r_2}{r_3} \right] \right) \\
& + (r_3 - 1)r_3 \left(r_1 F \left[\frac{r_4}{r_1}, \frac{r_2}{r_1} \right] + r_2 F \left[\frac{r_4}{r_2}, \frac{r_1}{r_2} \right] + r_4 F \left[\frac{r_1}{r_4}, \frac{r_2}{r_4} \right] \right) \\
& + (r_3 - r_4)(r_3 - 1)(r_4 - 1) \left(r_2 Li_2 \left[1 - \frac{r_1}{r_2} \right] + r_1 Li_2 \left[1 - \frac{r_2}{r_1} \right] \right) \\
& + r_3 r_4 (r_3 - r_4) \left(Li_2[1 - r_1] + Li_2[1 - r_2] + r_1 Li_2 \left[\frac{r_1 - 1}{r_1} \right] + r_2 Li_2 \left[\frac{r_2 - 1}{r_2} \right] \right) \\
& + r_4(r_4 - 1) \left(r_3 Li_2 \left[1 - \frac{r_1}{r_3} \right] + r_3 Li_2 \left[1 - \frac{r_2}{r_3} \right] + r_1 Li_2[1 - \frac{r_3}{r_1}] + r_2 Li_2[1 - \frac{r_3}{r_2}] \right) \\
& \left. - r_3(r_3 - 1) \left(r_4 Li_2 \left[1 - \frac{r_1}{r_4} \right] + r_4 Li_2 \left[1 - \frac{r_2}{r_4} \right] + r_1 Li_2[1 - \frac{r_4}{r_1}] + r_2 Li_2[1 - \frac{r_4}{r_2}] \right) \right]. \tag{1}
\end{aligned}$$

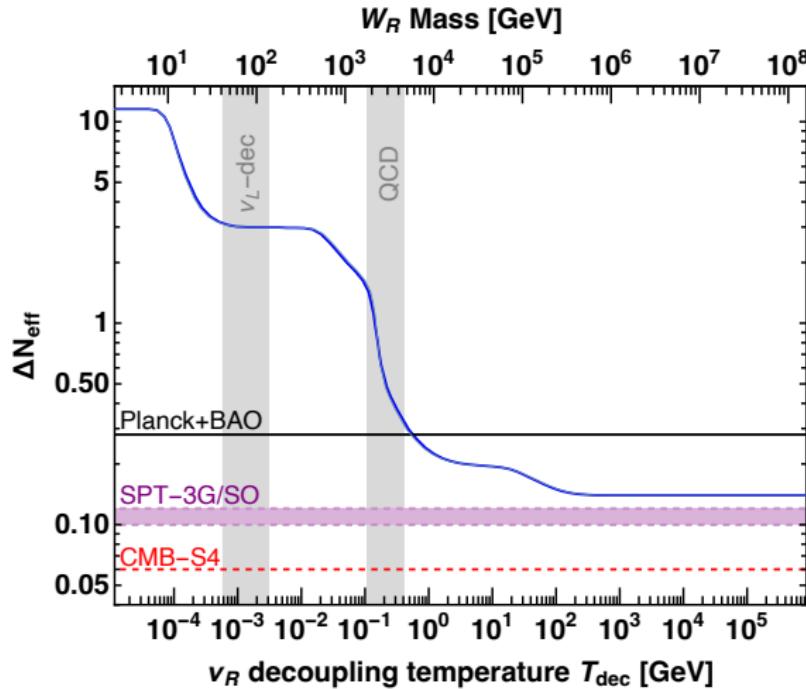

Neutrino Fit in Two-loop Dirac Mass Model

M_{E_3} / M_{W_R}	0.019	1.26	0.054	2.94	

- ▶ Ten parameters to fit oscillation data
- ▶ Both normal ordering and inverted ordering allowed
- ▶ Dirac CP phase is unconstrained
- ▶ Left-right symmetry breaking scale is not constrained

Tests in N_{eff} in Cosmology

- Dirac neutrino models will modify N_{eff} by about 0.14
- Can be tested in CMB measurements: $N_{\text{eff}} = 2.99 \pm 0.17$ (Planck+BAO)
- Present data sets a lower limit of 7 TeV on W_R mass

Conclusions

- ▶ Neutrino may very well be Dirac particles
- ▶ A left-right symmetric scenario is presented which is motivated on several other grounds
- ▶ Neutrinos may be pseudo-Dirac particles at a more fundamental level
- ▶ N_{eff} in cosmology can test these models
