Model Independent Measurement of Top Quark Mass using B-Hadron Decay Lengths (Part II)

SAGAR AIREN

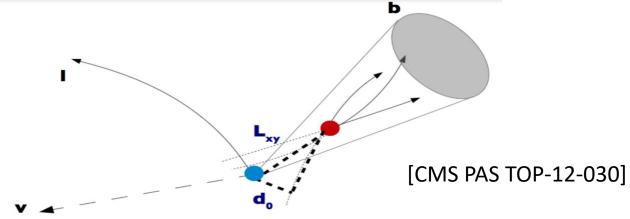

(WITH K. AGASHE, R. FRANCESCHINI, D. KIM, D. SATHYAN)

Part I (D. Sathyan)

- Energy spectrum of bottom quark, produced from unpolarized top quarks has an invariant energy peak $E^* = \frac{m_t^2 m_W^2 + m_b^2}{2m_t}$
- This result can be used to measure m_t independent of details of top production mechanism
- Using b-jet energies directly suffers from JES uncertainty

Part I (D. Sathyan)

- B hadron decay lengths L_{xyz} (Energy Peak) can be used instead as a proxy, no JES uncertainty
- Transverse component of B hadron decay lengths , L_{xy} (*SM*), have been used by CMS to measure m_t
- L_{xy} (SM) sensitive to top production mechanism, L_{xyz} (Energy Peak) is insensitive

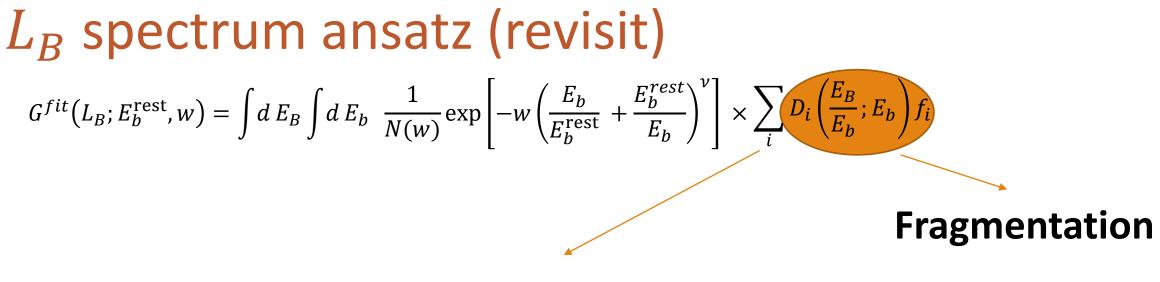

Outline

- B hadron decay length spectrum ansatz
- Event generation and selection
- Theory inputs and calibration
- Uncertainties
 - Statistical
 - Systematic
- Comparison to L_{xy} method
- Summary

$$L_{B} \text{ spectrum ansatz (revisit)}$$

$$G^{fit}(L_{B}; E_{b}^{\text{rest}}, w) = \int dE_{B} \int dE_{b} \left(\frac{1}{N(w)} \exp \left[-w \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}} \right)^{v} \right] \times \int \int dE_{b} \int dE_{b} \left(\frac{1}{N(w)} \exp \left[-w \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}} \right)^{v} \right] \times \int \int dE_{b} \int dE_{b} \int dE_{b} \left(\frac{1}{N(w)} \exp \left[-w \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}} \right)^{v} \right] \times \int \int dE_{b} \int dE_{b} \int dE_{b} \left(\frac{1}{N(w)} \exp \left[-w \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}} \right)^{v} \right] \times \int \int dE_{b} \int dE_{b} \int dE_{b} \left(\frac{1}{N(w)} \exp \left[-w \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}} \right)^{v} \right] \times \int \int dE_{b} \int dE_{b} \int dE_{b} \left(\frac{1}{N(w)} \exp \left[-w \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}} \right)^{v} \right] \times \int \int dE_{b} \int dE_{b} \int dE_{b} \left(\frac{1}{N(w)} \exp \left[-w \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}} \right)^{v} \right] \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}^{\text{rest}}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}^{\text{rest}}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}^{\text{rest}}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}^{\text{rest}}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}^{\text{rest}}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} + \frac{E_{b}^{\text{rest}}}{E_{b}^{\text{rest}}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{rest}}} \right)^{v} \times \int \int dE_{b} \left(\frac{E_{b}}{E_{b}^{\text{$$

 $i \rightarrow$ Multiple species

L_B spectrum ansatz (revisit) $G^{fit}(L_B; E_b^{\text{rest}}, w) = \int dE_B \int dE_b \left[\frac{1}{N(w)} \exp \left[-w \left(\frac{E_b}{E_b^{\text{rest}}} + \frac{E_b^{rest}}{E_b} \right)^{\nu} \right] \times$ $\sum_{i} D_{i} \left(\frac{E_{B}}{E_{b}}; E_{b} \right) f_{i} \frac{m_{B_{i}}}{c \tau_{B_{i}}^{rest} \sqrt{E_{B}^{2} - m_{B_{i}}^{2}}} \exp \left[- \left(\frac{L_{B}m_{B_{i}}}{c \tau_{B_{i}}^{rest} \sqrt{E_{B}^{2} - m_{B_{i}}^{2}}} \right) \right]$

Exponential Decay

L_B spectrum ansatz (revisit)

$$G^{fit}(L_B; E_b^{\text{rest}}, w) = \int dE_B \int dE_b \frac{1}{N(w)} \exp\left[-w\left(\frac{E_b}{E_b^{\text{rest}}} + \frac{E_b^{\text{rest}}}{E_b}\right)^{\nu}\right] \times$$

$$\sum_{i} D_{i} \left(\frac{E_{B}}{E_{b}}; E_{b} \right) f_{i} \frac{m_{B_{i}}}{c\tau_{B_{i}}^{rest} \sqrt{E_{B}^{2} - m_{B_{i}}^{2}}} \exp \left[- \left(\frac{L_{B}m_{B_{i}}}{c\tau_{B_{i}}^{rest} \sqrt{E_{B}^{2} - m_{B_{i}}^{2}}} \right) \right]$$

 $E_b^{\text{rest}} = (m_t^2 - M_W^2 + m_b^2)/(2m_t) \rightarrow \text{peak energy}$ $w \rightarrow \text{width of the fitting function}$

 $i \rightarrow B$ hadron species

 $\tau_{B_i}^{rest} \rightarrow$ mean rest frame lifetime for "i" B hadron

 $D_i\left(\frac{E_B}{E_b}; E_b\right) \rightarrow$ bottom quark fragmentation for species *i*

 $f_i \rightarrow$ relative fraction of species i

 $N(w) \rightarrow$ normalization factor

Event generation and Selection

• Generate signal events at parton level using MadGraph5

 $p p \rightarrow t \bar{t}$; $(t \rightarrow W^+ b)$; $(\bar{t} \rightarrow W^- \bar{b})$; only semi-leptonic and leptonic events

- Impose selection cuts [arXiv:1603.0653]
 - \rightarrow Semi-leptonic events
 - e^{\pm} with $p_T > 25 \ GeV$ and $|\eta| < 2.5$ or μ^{\pm} with $p_T > 25 \ GeV$ and $|\eta| < 2.1$
 - 4 jets with $p_T > 25 \text{ GeV}$ and $|\eta| < 2.5$
 - \rightarrow Leptonic events
 - 2 leptons with $p_T > 25 \ GeV$ and $|\eta| < 2.5$
 - 4 jets with $p_T > 25 \text{ GeV}$ and $|\eta| < 2.5$
 - MET > $40 \ GeV$
 - $M_{ll} > 20 \ GeV$ and $|M_{ll} M_z| > 15 \ GeV$

[Note: All p_T cuts set to the same value]

• Parton shower and hadronization using Pythia8

Theory inputs

- B hadron properties mass and lifetimes
- Fragmentation function
- Relative fraction of different species

All can be measured or calculated in principle. We use the values used in simulation.

Bias

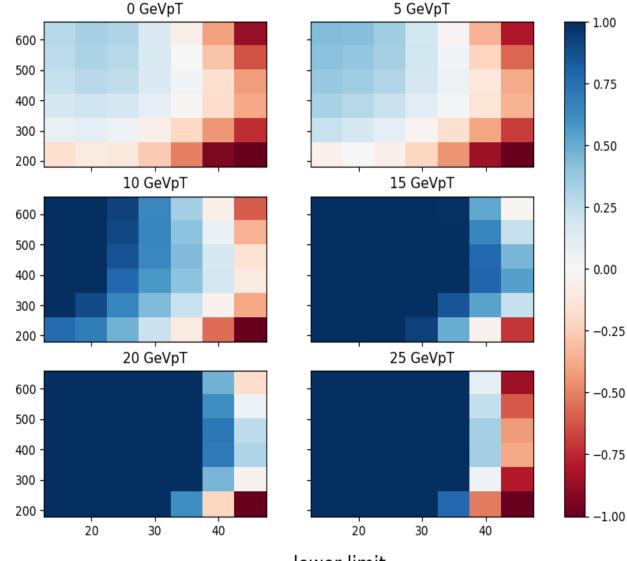

Hyper-parameters

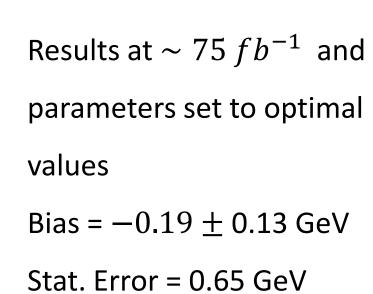

upper limit

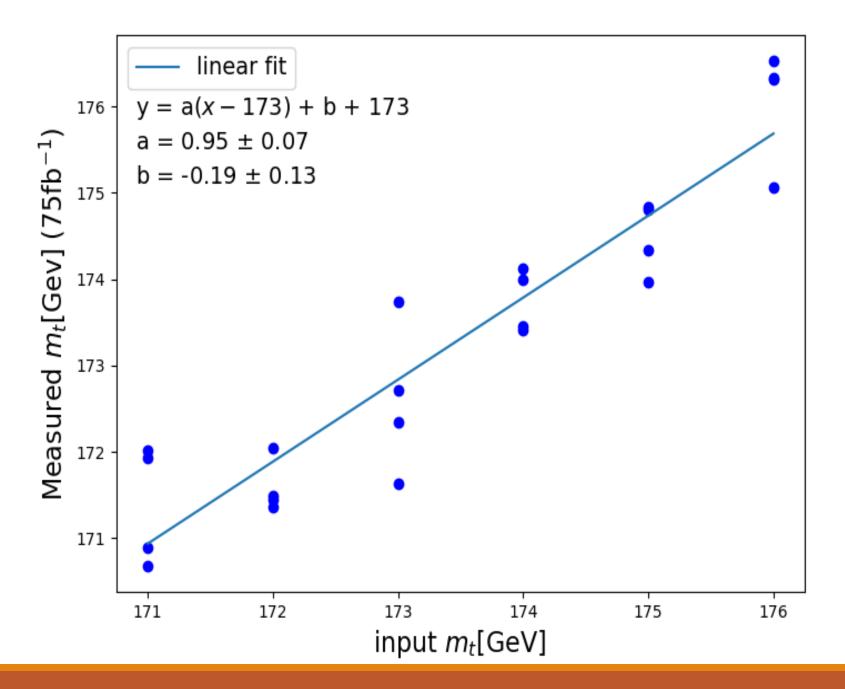

- ν parameter (0.3)
- Bounds on E_b integral ([40, 450] GeV)
- Fitting range ([0, 20] mm)

Hyper-parameters and selection cuts can lead to a bias in the measured mass. We optimize for minimal bias in the measurement.

lower limit

Uncertainties

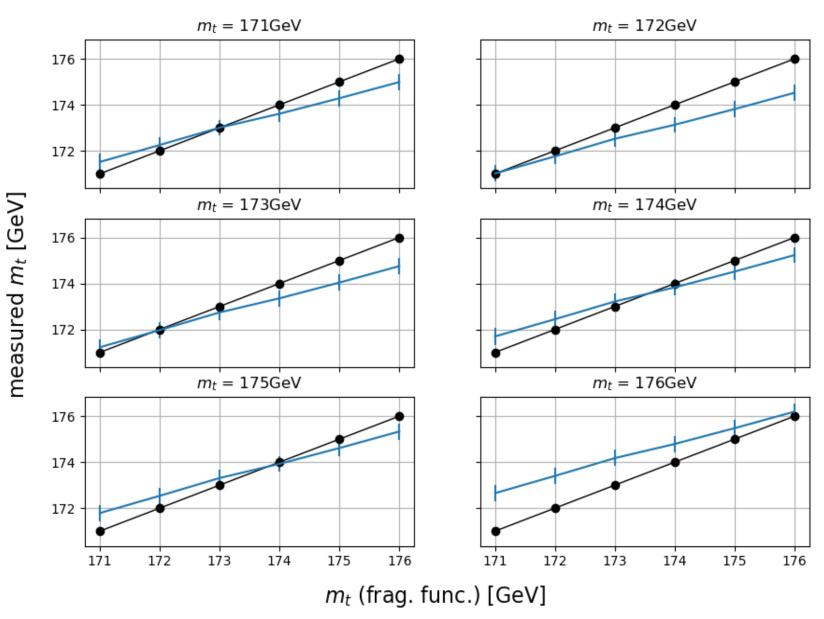

Theory inputs

- B hadron properties mass and lifetimes
- Fragmentation function
- Relative fraction of different species

Uncertainties

- Statistical error at 300 $fb^{-1} \approx 0.35 \ GeV$ and at $3 \ ab^{-1} \approx 0.1 \ GeV$
- Systematics Masses and lifetimes are varied by the known uncertainty [*PTEP* 2020 (2020) 8, 083C01]
- 10% variation in fractions correspond to roughly the difference between fractions measured at LEP and Tevatron [CMS PAS TOP-12-030]

Input	Variation	Maximum shift in m_t
m_{B_i}	0.005 %	0.004% (7 MeV)
$ au_{B_{i}}^{rest}$	0.25 %	0.18 % (350 MeV)
f_i	10 %	0.4 % (700 MeV)

Variation with fragmentation function

- A large uncertainty comes from fragmentation
- Moments of the fragmentation function shift with input m_t

5 GeV shift in $m_t \leftrightarrow \leq 1 \%$ shift in the moments move the prediction by about 3.5 GeV (~ 2%)

Comparison to L_{xy} (SM) method

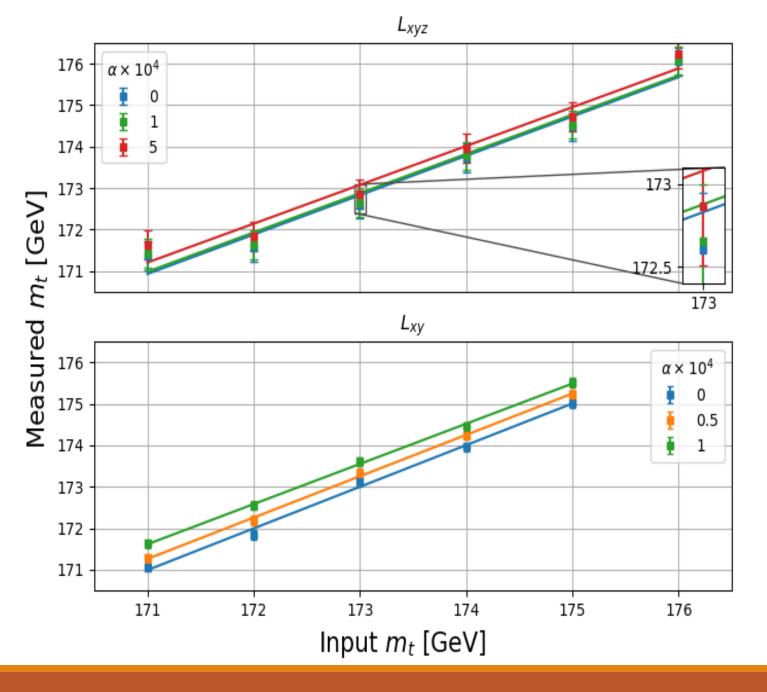

Comparison to L_{xy} method

- CMS already has used B hadron decay lengths to measure m_t
- Transverse decay length $\langle L_{xy} \rangle$, calculated using SM and then fit to data
- Modelling of p_T distribution of the top quark is the major source of systematic uncertainty (2.6 GeV) [CMS PAS TOP-12-030]
- L_{xyz} based on the energy peak idea is production mechanism independent
- Residual sensitivity to the top quark p_T spectrum due to the selection cuts and the hyper-parameters, but substantially less

[Note: Hadronization uncertainties same for both the methods]

 p_T reweighting to test the sensitivity – $\widetilde{w} = w[1 + \alpha\theta(p_T < 400)(p_T - 200)]$

For $\alpha = 10^{-4}$, $\langle p_T \rangle$ shifts by $\approx 0.5 \%$ (roughly the discrepancy/uncertainty) [Phys. Rev. D, 104(9):092013, 2021]

Summary

- Invariant energy peak idea to calculate B hadron decay length spectrum
- Unlike b-jet energy peak no JES uncertainty
- Compared to CMS L_{xy} (SM), insensitive to top quark transverse momentum distribution re-weighting
- A more thorough detector level analysis needed to confirm
