Overview

- ❖ Background Information
- ❖ Aims of the project
- ❖ Observation and Data reduction
- ❖ Results
- ❖ Conclusion

Introduction

- ❖ Radio galaxies are galaxies with an active nucleus (AGN = active galactic nucleus), harboring a supermassive black hole, powering relativistic beams (jets) of particles that extend over thousands of light years into intergalactic space.

Properties of radio galaxies (**Active Galaxies**):

- have a bright nucleus.
- are very luminous at radio wavelengths.
- are absolutely massive.
- emit synchrotron radiation.
- have gigantic jets pointing out of the galaxy.

Credit: [Aurore Simonnet, Sonoma State University](#)

Aims of the project

- (a) identify potentially interesting objects within the available MeerKAT fields for further study, based primarily on their radio morphology;
- (b) assemble available archival multi-wavelength data, including infrared, optical, and X-ray surveys as well as data from the Fermi Gamma-Ray Space Telescope;
- (c) build multi-wavelengths spectral energy distributions (SED) for those sources with sufficient multi-wavelength coverage; and
- (d) interpret them in the framework of AGN jet emission models to diagnose the physical properties of the jets and their environments.

Observation and Data reduction

- 64-dishes radio interferometer of 13.5 m-diameter each.
- Operational in UHF-band (0.58 – 1.0 GHz), L-band (0.9 – 1.67 GHz), S-band (1.73 – 3.5 GHz) see [Jonas & MeerKAT team \(2016\)](#).
- $\sim 7''$ of resolution.
- MeerKAT's shortest baseline is 29 m and longest baseline is 8 km.

Observation and Data reduction cont...

- The observation for this project were done MeerKAT's L-band receiver configuration.
- Which has a bandwidth of 856 MHz and a central frequency of 1.28 GHz.
- Used the oxkat v1.0 software ([Heywood 2020](#)) to reduce and process the data on ilifu cluster.
- oxkat is a semi-automated Python-based reduction pipeline for MeerKAT data, currently optimised for L-band continuum observations.
- Steps which were followed in ilifu cluster are:
 - First generation calibration (1GC): Cross-calibration and initial imaging
 - FLAG: Flagging
 - Second generation calibration (2GC): Self-calibration

Observation and Data reduction cont...

Field name	Observation date	Synthesized beam	rms ($\mu\text{Jy beam}^{-1}$)
FRB 20171019A	18 October 2019	6".8 x 5".0	5.2
FRB 20190711A	09 September 2019	12".5 x 4".9	4.6
FRB 20190714A	28 September 2019	6".5 x 5".1	5.8

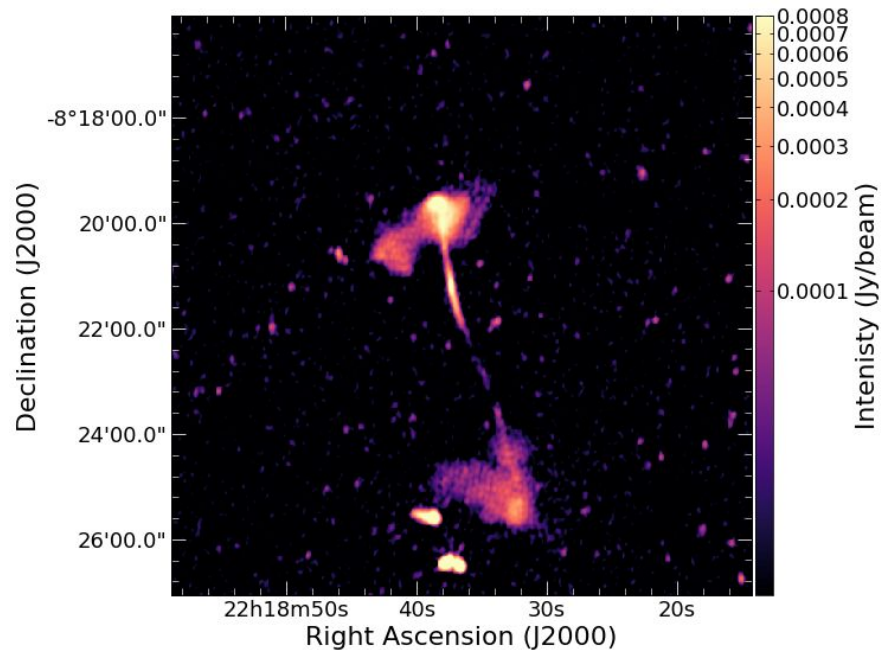

Table 1: Observations summary of the FRB fields from MeerKAT.

Results

- 86 radio galaxies were identified from all the three fields.

FRB 20171019A

MKAT J221834.96-082253.50

MKAT J221638.73-084451.87

High Energy band (2XMMi source data and 4FGL Fermi-LAT catalog)

MKAT J221834.96-082253.50

- MKAT J221834.96-082253.50 with the X-ray counterparts from 2XMMi source catalog (green circles).
- There was no FITS file/image found in the X-ray band.
- There was no counterparts found in 4FGL Fermi-LAT catalog.

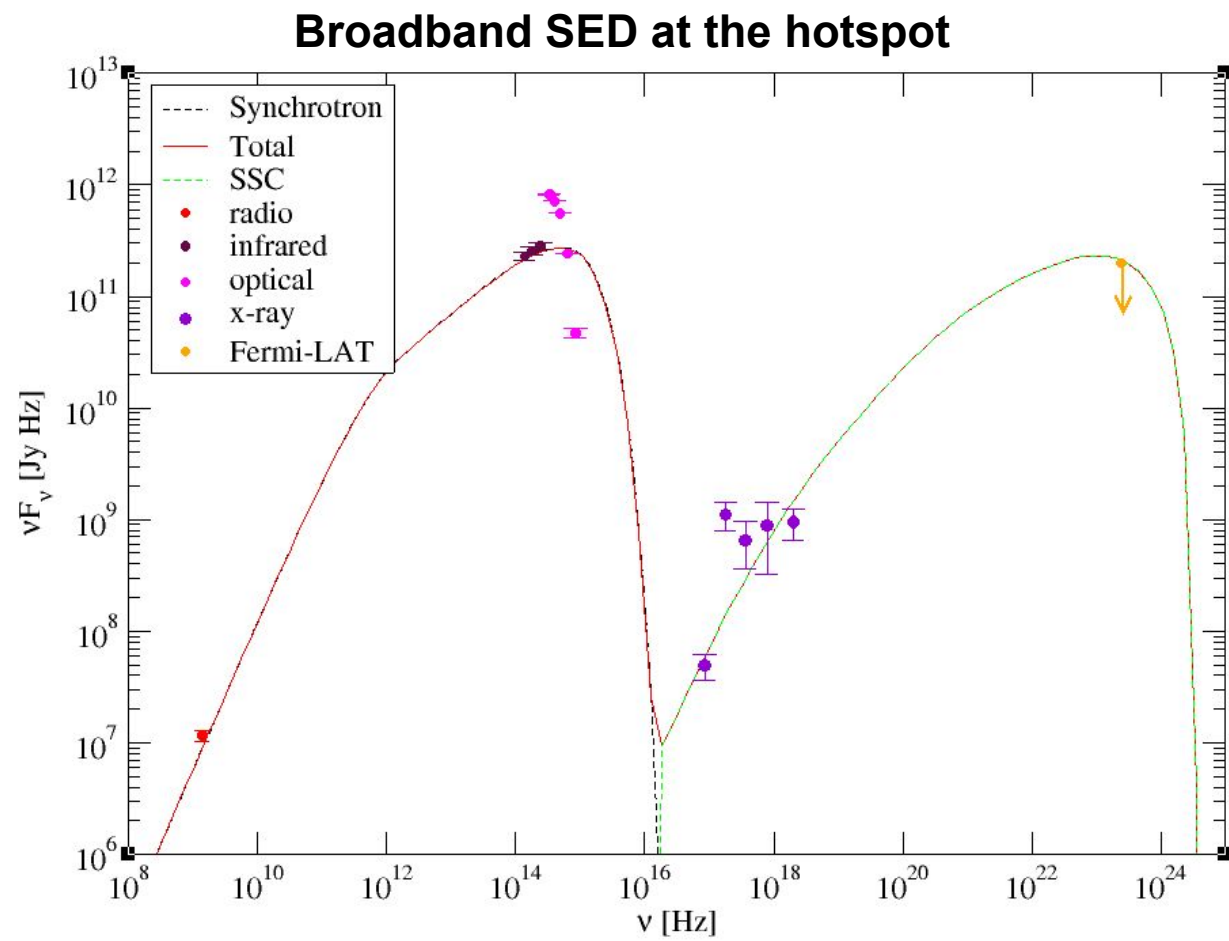

Results cont...

Spectral Energy Distributions (SED)

- Used the blazar code of [Boettcher et al. \(2013\)](#).
- Input parameters:
 - Injection luminosity [erg/s] = $2.5e44$
 - $\Gamma_{\min} = 2.5e4$
 - $\Gamma_{\max} = 3.8e4$
 - Escape time parameter ($t_{\text{esc}} = \eta R/c$) $\eta_{\text{esc}} = 0.25$
 - Magnetic field at z_0 [G] = 0.25
 - Blob radius [cm] = $1.2e18$
 - Observing angle [degrees] $\theta_{\text{obs}} = 90$
 - Redshift $z = 0.168$

Broadband SED at the core

Conclusion

- One radio galaxy was selected.
- Assembled available multi-wavelength data.
- Finding the Archival multi-wavelength FITS image.
- Built multi-wavelength spectral energy distributions (SED) for the core and hot-spot.
