GRB 221009A in Astro-COLIBRI

Circular 32636 GRB 221009A: Fermi GBM detection of an extraordinarily bright GRB

TITLE: GCN CIRCULAR
NUMBER: 32636
SUBJECT: GRB 221009A: Fermi GBM detection of an extraordinarily bright GRB
DATE: 22/10/09 20:54:36 GMT
FROM: Peter Veres at UAH <veresp@gmail.com>

P. Veres (UAH), E. Burns (LSU), E. Bissaldi (Politecnico and INFN Bari), S. Lesage (UAH), O. Roberts (USRA)
report on behalf of the Fermi GBM Team:

"At 2022-10-09 13:16:59.000 UT on 9 October 2022, the Fermi Gamma-Ray Burst Monitor (GBM) triggered and located GRB 221009A (trigger 687014224 / 221009553).

This event, if it is a GRB, it is the brightest among the GBM detected GRBs. If it is not a GRB then it is a rare transient event. Follow-up across all wavelengths is encouraged.

The on-ground calculated location, using the GBM trigger data, is RA = 290.4, DEC = 22.3 (J2000 degrees, equivalent to 19 h 22 m, 22 d 15 '), with a statistical uncertainty of 1 degrees (radius, 1-sigma containment, statistical only; there is additionally a systematic error which we have characterized as a core-plus-tail model, with 90% of GRBs having a 3.7 deg error and a small tail suffering a larger than 10 deg systematic error. [Connaughton et al. 2015, ApJS, 216, 32]).

This location is consistent with the Swift J1913.1+1946 localization (Dichiara et al. GCN 32632) though it precedes the Swift trigger by an hour.

The angle from the Fermi LAT boresight at the GBM trigger time is 76 degrees.

The GBM light curve consists of an initial ~10 s long pulse, followed by an extraordinarily bright episode at ~180 s after the trigger time, lasting at least 100 seconds.

Circular 32637 GRB 221009A or Swift J1913.1+1946: Fermi-LAT detection

TITLE: GCN CIRCULAR
NUMBER: 32637
SUBJECT: GRB 221009A or Swift J1913.1+1946: Fermi-LAT detection
DATE: 22/10/09 21:45:05 GMT
FROM: Elisabetta Bissaldi at INFN,Bari <elisabetta.bissaldi@ba.infn.it>

E Bissaldi (Politecnico and INFN Bari), N. Omodei (Stanford Univ.),
M. Kerr (NRL), report on behalf of the Fermi-LAT team:

At 14:17:05.99 on October, 09, 2022 Fermi-LAT detected high-energy emission
from Swift J1913.1+1946 or GRB 221009A, which was reported by
Swift (Dichiara et al. GCN #32632) and by GBM (Veres et al. GCN #32636).
The best LAT on-ground location is found to be

RA, Dec = 288.21, 19.73 (J2000)

with an error radius of 0.09 deg (90 % containment, statistical error only).
This was 94 deg from the LAT boresight at the time of the trigger.

The data from the Fermi-LAT show a significant increase in the event rate
that is spatially and temporally correlated with the trigger with high significance.

The 100 MeV - 1 GeV photon flux in the time interval 500-3500 s after
the Swift trigger is (1.27 +/- 0.16)E-05 ph/cm2/s.
The estimated photon index above 100 MeV is -2.12 +/- 0.11.
The highest-energy photon is a 7.8 GeV
which is observed 766 seconds after the Swift trigger.

The Fermi-LAT point of contact for this burst is
Elisabetta Bissaldi (elisabetta.bissaldi@ba.infn.it).

Circular 32658 GRB 221009A: Fermi-LAT refined analysis

TITLE: GCN CIRCULAR
NUMBER: 32658
SUBJECT: GRB 221009A: Fermi-LAT refined analysis
DATE: 22/10/10 13:42:46 GMT
FROM: Roberta Pillera at Politecnico and INFN Bari <roberta.pillera@ba.infn.it>

GRB 221009A: Fermi-LAT refined analysis

R. Pillera (Politecnico and INFN Bari), E Bissaldi (Politecnico and INFN Bari),
N. Omodei (Stanford Univ.), G. La Mura (LIP, Portugal),
F. Longo (University and INFN Trieste) report on behalf of the Fermi-LAT team:

We report updated observations of GRB 221009A which was detected by Swift (Kennea et al. GCN #32635), Fermi-GBM (Veres et al. GCN #32636, Lesage et al. GCN #32642), Fermi-LAT (Bissaldi et al. GCN #32637), and the IPN (Svinkin et al. GCN #32641).

GRB 221009A triggered Fermi-GBM on October 10, 2022, at 13:16:59.99 UT (trigger 687014224/221009553), about 1 hour earlier with respect to the Swift trigger, which was reported as a new bright hard X-ray and optical transient and tentatively classified as Swift J1913.1+1946 (Dichiara et al., GCN 32632). Prompt GCN notices from Fermi-GBM were not distributed due to problems with the real-time downlink from TDRS, therefore no automatic Fermi-LAT GRB pipelines were triggered by the GBM event.

Using LAT events with E>100 MeV between T0+200 s and T0+800 s, we find a LAT localization of

RA = 288.282, Dec = 19.495,

with a 90% containment radius of 0.027 degrees (statistical only).

with a 90% containment radius of 0.027 degrees (statistical only).

The LAT lightcurve shows a bright structured emission episode which is temporally coincident with the GBM main emission episode starting at T0+200s.
The 100 MeV - 1 GeV photon flux in the time interval 200-800 s after the GBM trigger is (6.2 +/- 0.4)E-03 ph/cm2/s.
The estimated photon index above 100 MeV is -1.87 +/- 0.04.

From a preliminary analysis, the LAT emission is extending for about 25ks post GBM trigger.
The highest-energy photon is 99.3 GeV (with a probability of 99.2%) which is observed 240 seconds after the GBM trigger.
This represents the highest GRB photon energy ever detected by Fermi-LAT (the previous record holder being a 95 GeV event from GRB 130427A).

The Fermi-LAT point of contact for this burst is Elisabetta Bissaldi (elisabetta.bissaldi@ba.infn.it).

The Fermi-LAT is a pair conversion telescope designed to cover the energy band from 20 MeV to greater than 300 GeV. It is the product of an international collaboration between NASA and DOE in the U.S. and many scientific institutions across France, Italy, Japan and Sweden.

@AstroColibri

Btw.: the lightcurve sticks out even more from the archival set of GRBs when you use the burst detection time by GBM onboard @NASAFermi instead of the one derived by @NASASwift. Really an extraordinary event!
