# HEP Benchmarks project goal

- ❑ Identify a replacement of HS06 for CPUs

- ❑ Reasons

- HS06 is not supported anymore by SPEC (since 2018)
- Signs of discrepancies w.r.t. the “run2” LHC Experiments’ applications
  - Could be worse with run3 applications
- HS06 is not a HEP-specific benchmark
  - Desire to apply the same benchmark to other architectures (ARM, GPUs, ...)

- ❑ HEPscore is proposed by the HEPiX Benchmarking WG

- Uses the workloads of the experiments as application benchmarks
- Combine them in a single score as HS06 does

# HEP Benchmarks project

Three main components

## – HEP Workloads

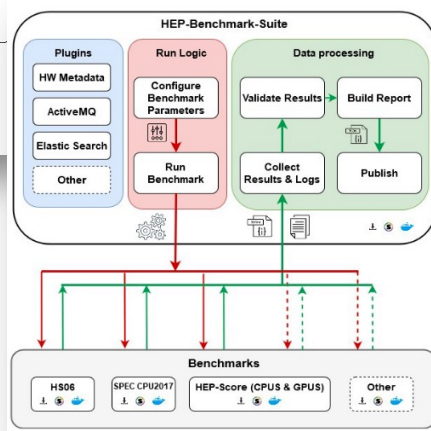

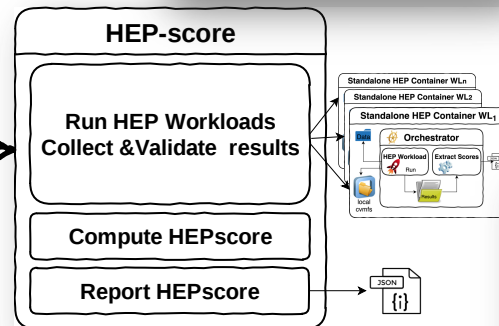

- Individual **reference** HEP applications
- Common build infrastructure

## – HEP Score

- Orchestrate the run of a series of HEP workloads
- Compute the **HEPscore** value
- Report whole set of WL results

## – HEP Benchmark Suite

- Orchestrator of multiple benchmark suites
  - HEPscore, HS06, SPEC CPU2017...

# Achievements

- ❑ HEP Workloads “containerized” and fully validated
  - LHC Experiments (Run2 version) + Belle II
    - All production steps (Gen, Sim, Digi, Reco) available
  - GPU workloads SimpleTrack (LHC simulation)
- ❑ HEPscore v1.2 released
  - Singularity & Docker supported, improved report, Python wheels available
  - Default config validated up to 256 cores
- ❑ HEP Benchmark Suite v2.1 released
  - Metadata section with detailed HW information, install as unprivileged user, python wheels available
- ❑ HS06 extended to ARM CPUs
- ❑ HEPiX Spring presentation & Demo

# Achievements (II)

- ❑ Analysis of HEPscore Vs HS06 measurements
  - Using the demonstrator benchmark,  $\text{HEPscore}_\beta$ ,
  - Outcome: *it may be possible to create a new benchmark for CPUs based on HEP applications*
    - Presented in the Autumn HEPiX workshop
    - Publication accepted by *Computing and Software for Big Science*
      - “HEPiX benchmarking solution for WLCG computing resources”
- ❑ Positive feedback from early adopters

## HEPiX benchmarking solution for WLCG computing resources

**Abstract** The HEPiX Benchmarking Working Group 1 Introduction  
has developed a framework to benchmark the perfor-

## Impression of HEPsuite

- The results produced by HEPscore benchmark felt more accurate.
  - There was less difference from a performance to cost ratio between the CPUs.
- It was easy for both us and the vendors to run!
- For a benchmark suite I wasn't confident it was producing standard results.
  - By default the HEPspec06 score was 64 bit, when we have always had to use 32 bit for all the WLCG pledges / accounting.
  - The SPEC17 scores didn't match up with scores reported on the website.

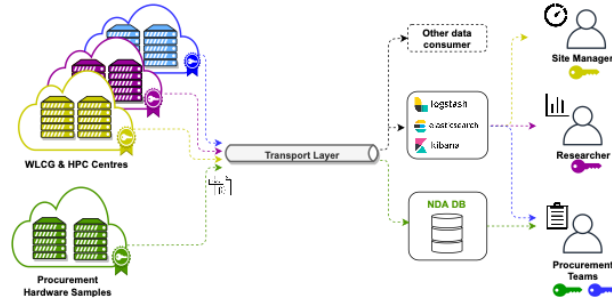

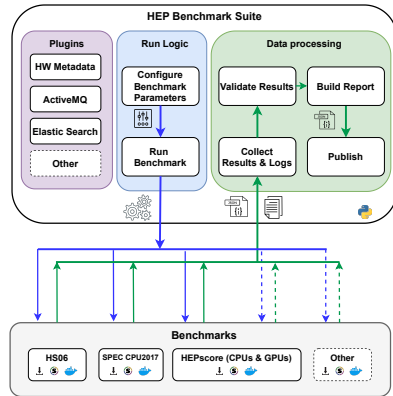

# Current work

- ❑ Inclusion of new WLCG workloads in the HEP Workloads catalogue
  - In collaboration with the HEPscore deployment Task Force
  - Identified WLs other than LHC experiments
- ❑ Start a campaign of measurements
  - Multiple CPU models from several sites
  - Multiple benchmarks (HS06, SPEC CPU 2017, HEPscore)
- ❑ Objective
  - Compare HEP WL performance, identify representative subset for what will be HEPscore2X configuration
  - Compare performance w.r.t. SPEC benchmarks

# HEP Benchmark Suite

- ❑ Is the toolkit to run and collect results centrally
  - Execution of multiple benchmarks; document validation; metadata enrichment
- ❑ Used @ CERN in the enrollment of all servers. Several benchmark scores are collected and monitored

# Conclusions

- ❑ The HEP Benchmarks project is progressing well
- ❑ The composition of HEPscore2x will be likely defined in 2022
  - After approval of WLCG, it's reasonable to envisage a period of coexistence of HS06 and HEPscore benchmarks
- ❑ Feedback and support request welcome in the dedicated [Discourse Forum](#) and [gitlab issues](#) tracker

# Benchmark comparing “speed factors”

❑ In order to compare servers **HS06** and **HEP-Score** implement the **geometric mean** approach. Needs:

- a set of reference workloads (**WLs**)
- a measure of performance per WL (**m<sub>i</sub>**), that typically goes as [1/s] (eg. can be the event throughput)
- a reference machine

$$\bar{x} = \left( \prod_{i=1}^n x_i^{w_i} \right)^{1 / \sum_{i=1}^n w_i}$$

[https://en.wikipedia.org/wiki/Weighted\\_geometric\\_mean](https://en.wikipedia.org/wiki/Weighted_geometric_mean)

❑ The score **S** of a server (**srv**) is defined as the **geometric mean** of the **speed factors**  $x_i(\text{srv}, \text{ref}) = m_i(\text{srv}) / m_i(\text{ref})$  respect to the reference machine (**ref**)

– i.e. “speed” is *normalised* respect to the reference machine “speed”

❑ The relative score between **srv<sub>A</sub>** and **srv<sub>B</sub>** is the ratio of the scores **S(srv,ref)**, this is still a geometric mean of speed factors

	WL <sub>1</sub> 		WL <sub>2</sub> 		WL <sub>n</sub> 		Score	S(A,B)
<b>Ref. Srv</b> 	m <sub>1</sub> (ref)	1 (by def)	m <sub>2</sub> (ref)	1 (by def)	m <sub>n</sub> (ref)	1 (by def)	$\left( \prod_{i=1}^n x_i \right)^{\frac{1}{n}}$	
<b>Srv A</b> 	m <sub>1</sub> (A)	$x_1(\text{A}, \text{ref})$	m <sub>2</sub> (A)	$x_2(\text{A}, \text{ref})$	m <sub>n</sub> (A)	$x_n(\text{A}, \text{ref})$	S(A,ref)	$\frac{S(\text{A}, \text{ref})}{S(\text{B}, \text{ref})}$
<b>Srv B</b> 	m <sub>1</sub> (B)	$x_1(\text{B}, \text{ref})$	m <sub>2</sub> (B)	$x_2(\text{B}, \text{ref})$	m <sub>n</sub> (B)	$x_n(\text{B}, \text{ref})$	S(B,ref)
