		$(v$	$+$	v^3	$+$	v^5	$+$	$\ldots)$	G^4

Radiated Angular Momentum

*We do not intend to resolve the BMS subtlety here

[Peters]

Radiated Angular Momentum

- Textbook formula for angular momentum

$$J^i = \frac{c^2}{32\pi G} \int d^3x \left[-\epsilon^{ikl} \dot{h}^{\mathrm{TT}}_{ab} x^k \partial^l h^{\mathrm{TT}}_{ab} + 2\epsilon^{ikl} h^{\mathrm{TT}}_{ak} \dot{h}^{\mathrm{TT}}_{al} \right] . \qquad (2.51)$$

Why not covariant?

How to see gauge invariance?

Radiated Angular Momentum

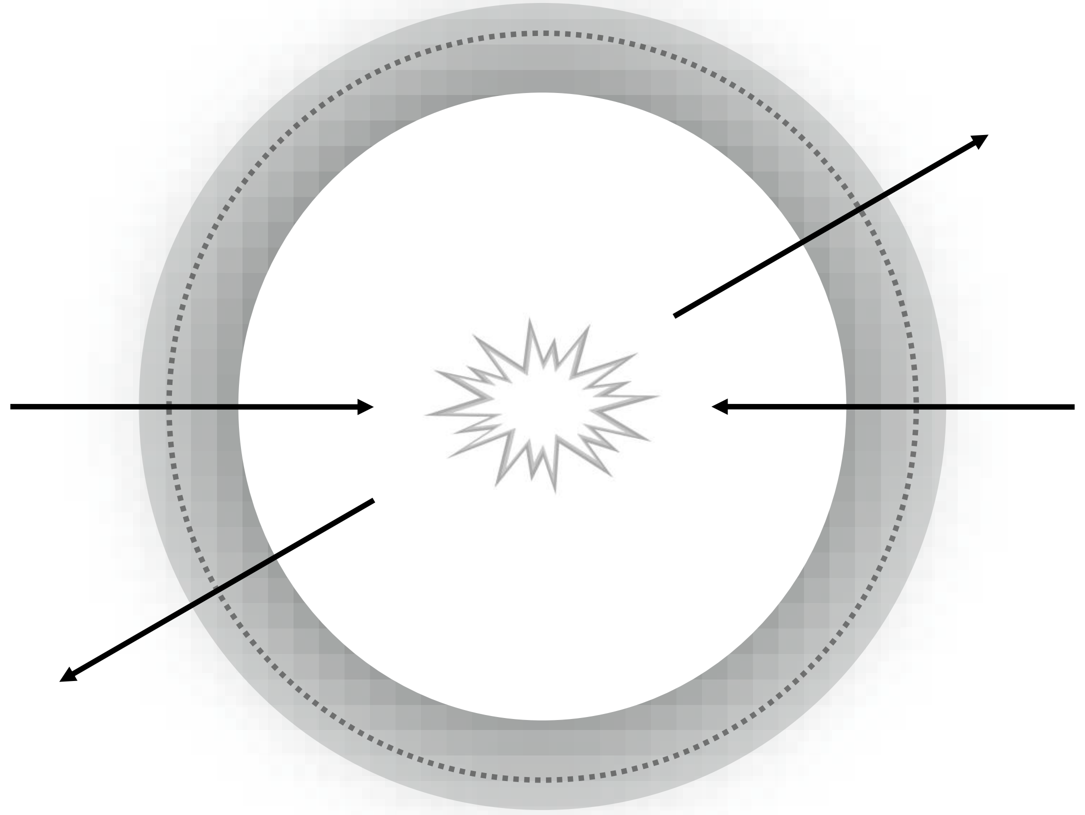
- Consider the final state of scattering.

  The radiated linear and angular momentum are

$$P^\mu = \int \mathrm{d}^3x\, T^{\mu 0}$$

$$J^{\mu\nu} = \int \mathrm{d}^3x\, \underline{x^{[\mu}} T^{\nu]0}$$

$u = t - r \sim 0$

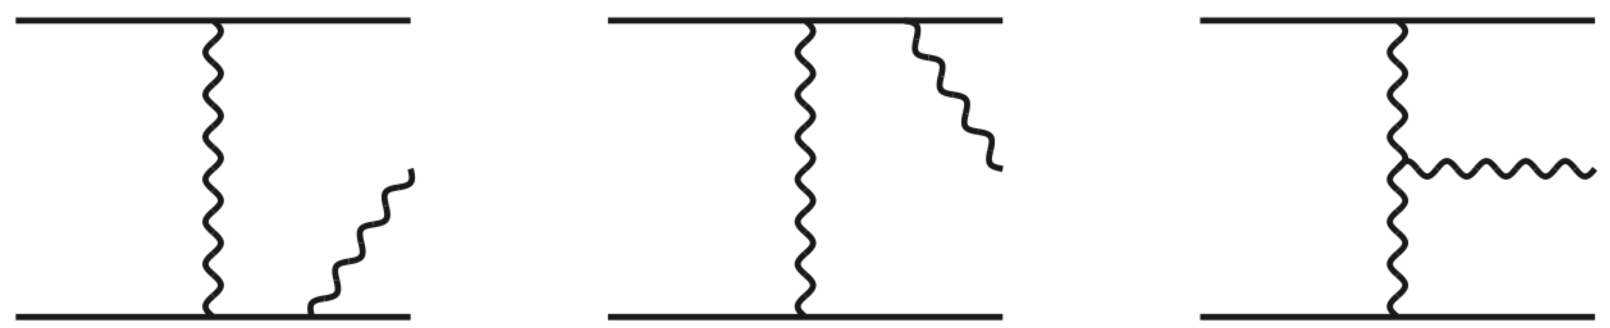


- Need to include the $1/r^2$ of the field for angular momentum

Sources ⟶ Fields ⟶ $T^{\mu\nu}$ ⟶ linear/angular momentum

Sources

- EM: currents $\mathcal{J}^\mu$
  - 3 degrees of freedom under conservation $k_\nu \mathcal{J}^\nu(k) = 0 \quad \partial_\mu \mathcal{J}^\mu(x) = 0$
  - "on-shell" part can be projected to transverse mode
    $\mathcal{J}^\nu(k) \to \mathcal{J}^\nu(k) + \alpha k^\nu$



- Gravity: stress-energy pseudotensor $\mathcal{T}^{\mu\nu}$
  - 6 degrees of freedom under conservation $k_\mu \mathcal{T}^{\mu\nu}(k) = 0 \quad \partial_\mu \mathcal{T}^{\mu\nu}(x) = 0$
  - "on-shell" part can be projected to traceless and transverse mode
    $\mathcal{T}^{\mu\nu}(k) \to \mathcal{T}^{\mu\nu}(k) + k^\mu \epsilon^\nu(k) + k^\nu \epsilon^\mu(k)$

Fields

- Solved by fixing a gauge, e.g., under Lorentz gauge $\Box A_\mu = 4\pi J_\mu$

- No ambiguity after gauge fixing, even for static sources

- Position space:

Needed for angular momentum

$$A^\mu(x) = \int d\omega e^{-i\omega u}\left(\frac{1}{r}\mathcal{J}^\mu(k=\omega(1,\hat{r})) + \frac{1}{r^2}\mathcal{O}(\partial_k J)\right)$$

residual gauge redundancy
→ **2 degrees** of freedom
→ amplitudes!

No gauge redundancy
→ **≥2 degrees** of freedom

$$\vec{E} = \frac{Q\hat{r}}{r^2}$$

Fields

- Solved by fixing a gauge, e.g., under Lorentz gauge $\Box A_\mu = 4\pi J_\mu$
- No ambiguity after gauge fixing, even for static sources
- Momentum space: $k^2 = 0$

$$A_\mu(x) = \int \underline{\widetilde{dk}}\,\big(\underline{\mathcal{J}_\mu(k)}\,e^{-ik\cdot x} + \text{c.c.}\big)$$

Lorentz-invariant phase space sources (current or stress-energy pseudotensor)

Stress-energy Tensor

- EM: gauge-invariant

$$T^{\mu\nu} = -F^{\mu}_{\rho}F^{\nu\rho} + \eta^{\mu\nu}\frac{1}{4}F^{\rho\sigma}F_{\rho\sigma}$$

- Gravity: *not* gauge invariant

$$T_{\mu\nu} = -\frac{1}{8\pi G}\left(R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R\right)$$

- But global charges are gauge invariant

Radiated Poincare Charges

- Radiated linear and angular momentum are

$$P^\mu = \int \mathrm{d}^3x\, T^{\mu 0}$$

$$J^{\mu\nu} = \int \mathrm{d}^3x\, x^{[\mu} T^{\nu]0}$$

- Need to include the $1/r^2$ of the field, so we use sources instead of amplitudes

Sources $\longrightarrow$ Fields $\longrightarrow$ $T^{\mu\nu}$ $\longrightarrow$ linear/angular momentum

Radiated Linear Momentum

- Linear momentum:
  same as cross section weighted by momentum
- EM: $$P^\mu = \int \underbrace{\widetilde{dk}}_{\text{Phase space integral}} \, \underbrace{k^\mu}_{\text{momentum}} \, \underbrace{\left(-\mathcal{J}^{*\rho}(k)\mathcal{J}_\rho(k)\right)}_{\text{cross section}}$$
  Phase space integral momentum cross section
- GR: $$P^\mu = 8\pi G \int \widetilde{\mathrm{d}k} \, k^\mu \left(\mathcal{T}^{*\rho\sigma}(k)\mathcal{T}_{\rho\sigma}(k) - \frac{\mathcal{T}_\rho^{*\rho}(k)\mathcal{T}_\sigma^\sigma(k)}{D-2}\right)$$
- Covariance and gauge invariance are obvious
- Directly related to on-shell amplitudes via KMOC

Radiated Angular Momentum

- New covariant formula in GR for angular momentum

$$P^\mu = 8\pi G \int \widetilde{dk}\, k^\mu \left(\mathcal{T}^{*\rho\sigma}(k)\mathcal{T}_{\rho\sigma}(k) - \frac{\mathcal{T}_\rho^{*\rho}(k)\mathcal{T}_\sigma^{\sigma}(k)}{D-2} \right), \qquad \mathcal{L}^{\mu\nu} = ik^\mu \frac{\partial}{\partial k_\nu} - ik^\nu \frac{\partial}{\partial k_\mu}$$

$$J^{\mu\nu} = 8\pi G \int \widetilde{dk} \left(\mathcal{T}^{*\rho\sigma}(k)\mathcal{L}^{\mu\nu}\mathcal{T}_{\rho\sigma}(k) - \frac{\mathcal{T}_\rho^{*\rho}(k)\mathcal{L}^{\mu\nu}\mathcal{T}_\sigma^{\sigma}(k)}{D-2} + 2i\, \mathcal{T}^{*\rho[\mu}(k)\mathcal{T}^{\nu]}{}_\rho(k) \right)$$

[Manohar, Ridgway, **CHS**]

[Manohar, Ridgway, **CHS**]

Radiated Angular Momentum

-
$$P^\mu = 8\pi G \int \widetilde{dk}\, k^\mu \left(\mathcal{T}^{*\rho\sigma}(k)\mathcal{T}_{\rho\sigma}(k) - \frac{\mathcal{T}^{*\rho}_{\rho}(k)\mathcal{T}^{\sigma}_{\sigma}(k)}{D-2} \right), \qquad \mathcal{L}^{\mu\nu} = ik^\mu \frac{\partial}{\partial k_\nu} - ik^\nu \frac{\partial}{\partial k_\mu}$$

$$J^{\mu\nu} = 8\pi G \int \widetilde{dk} \left(\mathcal{T}^{*\rho\sigma}(k)\mathcal{L}^{\mu\nu}\mathcal{T}_{\rho\sigma}(k) - \frac{\mathcal{T}^{*\rho}_{\rho}(k)\mathcal{L}^{\mu\nu}\mathcal{T}^{\sigma}_{\sigma}(k)}{D-2} + 2i\,\mathcal{T}^{*\rho[\mu}(k)\mathcal{T}^{\nu]}{}_{\rho}(k) \right)$$

- **Poincare algebra:**

$$x^\mu \to x^\mu + a^\mu \qquad\longrightarrow\qquad P^\mu \to P^\mu$$

$$\mathcal{T}^{\mu\nu}(k) \to \mathcal{T}^{\mu\nu}(k)e^{ik\cdot a} \qquad\qquad J^{\mu\nu} \to J^{\mu\nu} + a^{[\mu}P^{\nu]}$$

- **Gauge invariance:** $\mathcal{T}^{\mu\nu}(k) \to \mathcal{T}^{\mu\nu}(k) + k^\mu \epsilon^\nu(k) + k^\nu \epsilon^\mu(k)$

  - No physical separation b/w “orbital” and “spin” parts

Zero-Frequency Limit & Leading order

(Weinberg soft theorem, memory effect,…)

[Weinberg]

[see talks by Pasterski, Pate, Spradlin]

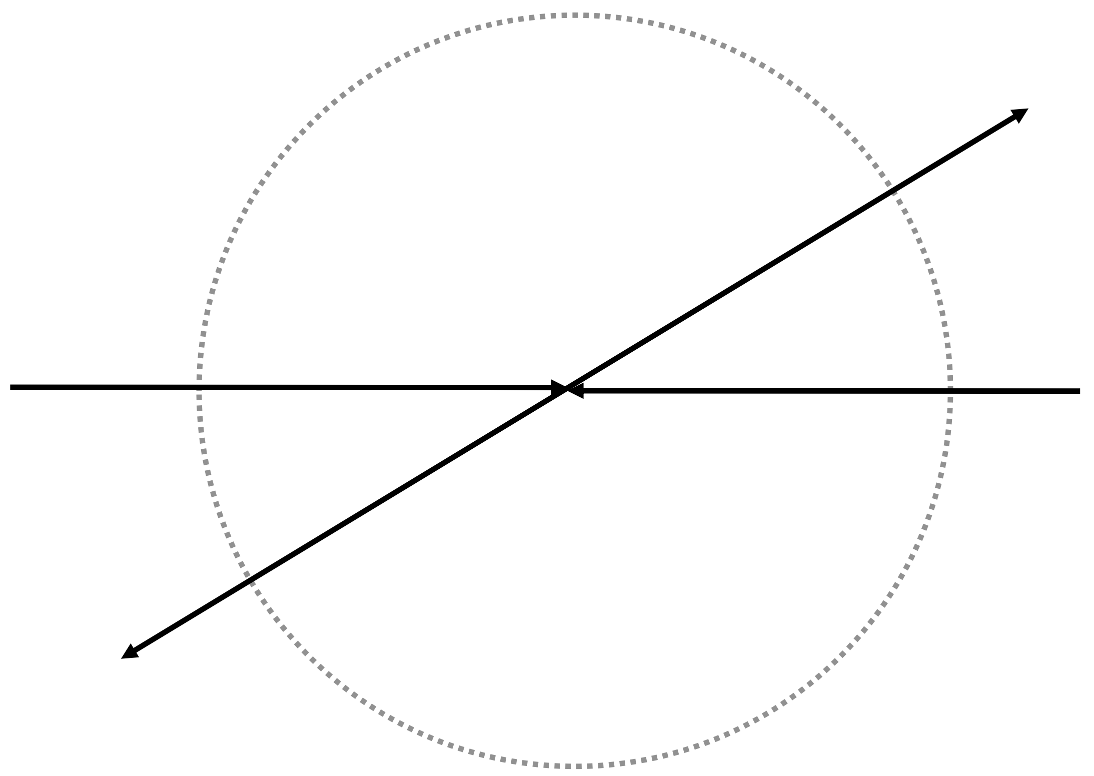
Stress-energy Pseudotensor

- Zoom out the time scale so collision occurs at t=0 (zero-frequency limit)

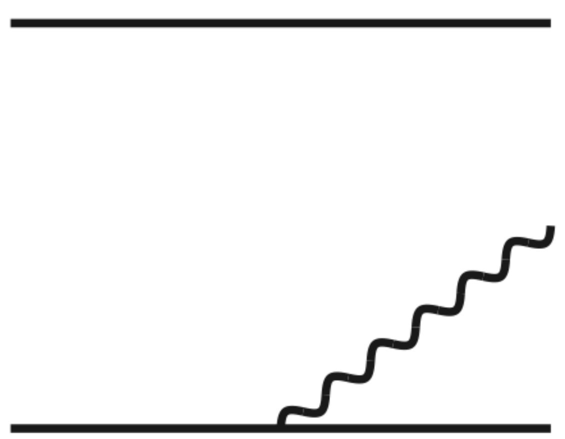
$$\mathcal{T}^{\mu\nu}(k)|_{\omega\to 0^+} = -i\pi\delta(\omega)\sum_a \frac{p_a^\mu p_a^\nu}{E_a - \hat{\mathbf{k}}\cdot\mathbf{p}_a} + \frac{1}{\omega + i0}\sum_a \left(\frac{p_a^\mu p_a^\nu}{E_a - \hat{\mathbf{k}}\cdot\mathbf{p}_a}\right)\Bigg|_i^f$$

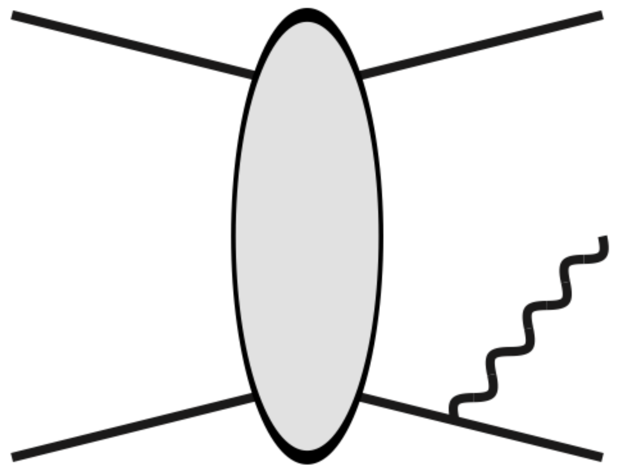
Free particles
(Coulomb mode)

deflection turned on at t=0
valid to all orders



$\delta(u = t - r)$





Radiated angular momentum

- Zero-frequency limit

$$P^\mu = 0,$$

$$J^{\mu\nu} = 8\pi G \int \underline{\widetilde{dk}} \left(\underline{\mathcal{T}^{*\rho\sigma}(k)} \mathcal{L}^{\mu\nu} \underline{\mathcal{T}_{\rho\sigma}(k)} - \frac{\mathcal{T}^{*\rho}_{\rho}(k)\mathcal{L}^{\mu\nu}\mathcal{T}^{\sigma}_{\sigma}(k)}{D-2} + 2i\,\mathcal{T}^{*\rho[\mu}(k)\mathcal{T}^{\nu]}{}_{\rho}(k) \right)$$

$$d\omega\,\omega \quad \delta(\omega) \qquad \frac{1}{\omega}$$

- Nothing wrong w/ zero energy but non-zero angular momentum

$$\mathbf{J} = \mathbf{r} \times \mathbf{p} \sim \int d\Omega r^2\, \mathbf{r} \times (\mathbf{E} \times \mathbf{B})$$

$$\frac{1}{r^2} \qquad \frac{1}{r}$$

Radiated angular momentum

- Leading order in deflection angle θ

$$\frac{J^{12}_{\rm CM,2}}{\mathsf{J}_{\rm CM}} = 2\times\frac{J^{12}_{\rm rest,2}}{\mathsf{J}_{\rm rest}} = 2m_1m_2\,\mathcal{I}(\sigma)\,\theta$$

$$\mathcal{I}(\sigma) = -\frac{16}{3} + \frac{2\sigma^2}{\sigma^2-1} + \frac{4(2\sigma^2-3)}{\sigma^2-1}\,\frac{\sigma\,\mathrm{arcsinh}\left(\sqrt{\frac{\sigma-1}{2}}\right)}{\sqrt{\sigma^2-1}}$$

- Model independent

  (GR, with spin, dilaton gravity, supergravity, etc)

- Radiated Angular momentum ***is positive*** when scattering is ***attractive***

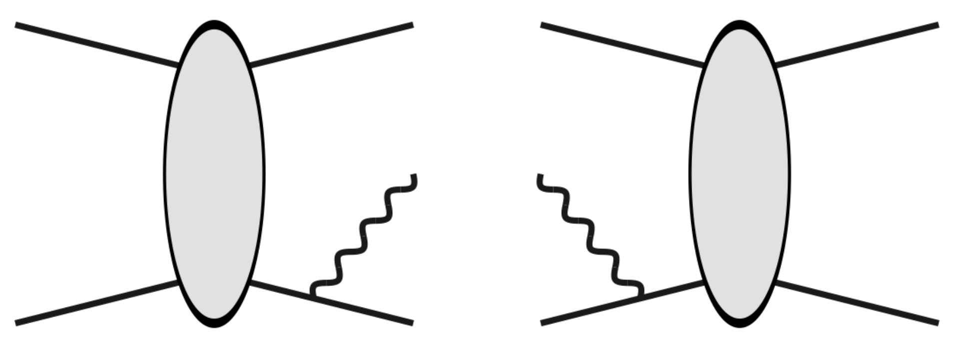
New

Soft Finiteness to all orders

- Total radiated angular momentum is finite

$$J^{\mu\nu} = 8\pi G \int \widetilde{dk} \left(\mathcal{T}^{*\rho\sigma}(k)\mathcal{L}^{\mu\nu}\mathcal{T}_{\rho\sigma}(k) - \frac{\mathcal{T}_{\rho}^{*\rho}(k)\mathcal{L}^{\mu\nu}\mathcal{T}_{\sigma}^{\sigma}(k)}{D-2} + 2i\,\mathcal{T}^{*\rho[\mu}(k)\mathcal{T}^{\nu]}{}_{\rho}(k) \right)$$

$$\int d\Omega \int d\omega\, \omega \quad \frac{1}{\omega} \qquad \frac{1}{\omega}$$



- soft divergence cancels after integrating the full sphere

Comparison

- J^{12} at G^2 agrees with [Damour]
- Fully agrees arbitrary deflection [Di Vecchia, Heissenberg, Russo]
- J^{0i} at G^2 agrees with [Gralla, Lobo] (modulo a potential extra term)
- Disagree with the textbook formula in the initial rest frame by x2
  [Jakobsen, Mogull, Plefka, Steinhoff][Mougiakakos, Riva, Vernizzi]

Leading O(G^2) results

Textbook formula
TT part of metric

$$\frac{J^{12}_{\mathrm{rest},2}}{\mathsf{J}_{\mathrm{rest}}} = \frac{J^{12}_{\mathrm{CM},2}}{\mathsf{J}_{\mathrm{CM}}}$$

Our formula
stress-energy pseudotensor

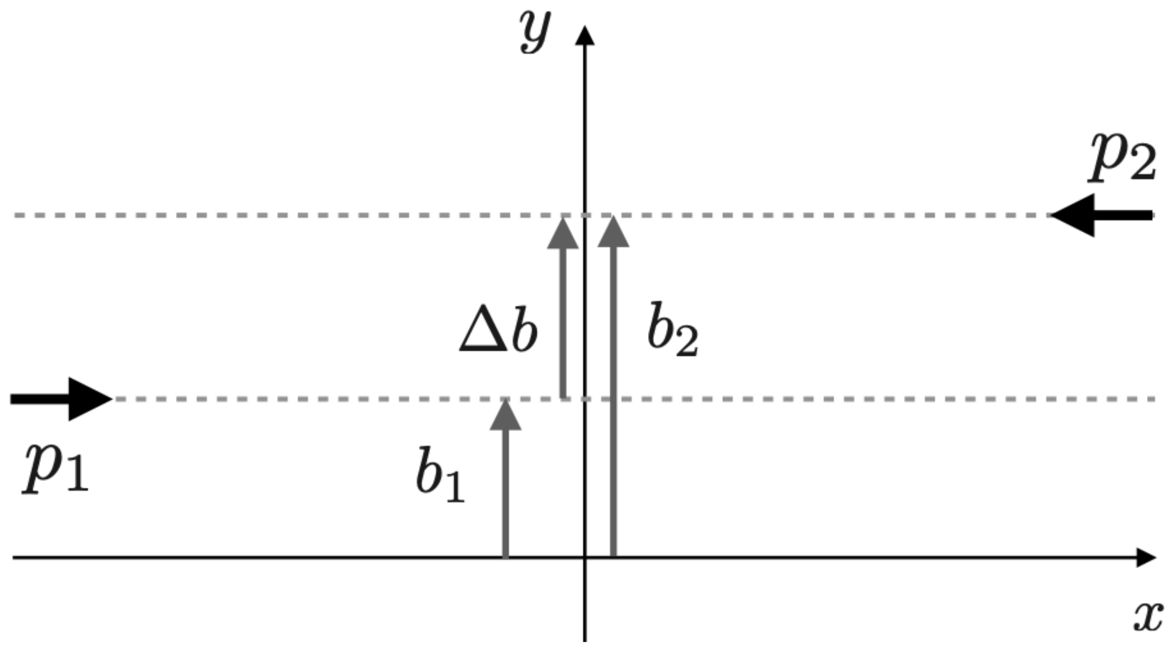
$$\frac{J^{12}_{\mathrm{rest},2}}{\mathsf{J}_{\mathrm{rest}}} = \frac{1}{2} \times \frac{J^{12}_{\mathrm{CM},2}}{\mathsf{J}_{\mathrm{CM}}}$$

- Both agree in the CM frame
- Independent checks: general covariance and 3.5PN RR force

[Jaranowski, Schafer; Nissanke, Blanchet]

Non-perturbative Parametrization

- Form factors: Lorentz covariance +Poincare algebra



$$P^\mu = F_1 p_1^\mu + F_2 p_2^\mu + F_3 \Delta b^\mu,$$

$$J^{\mu\nu} = \bar{b}^{[\mu}\left(F_1 p_1^{\nu]} + F_2 p_2^{\nu]} + F_3 \Delta b^{\nu]}\right) + \Delta b^{[\mu}\left(G_1 p_1^{\nu]} - G_2 p_2^{\nu]}\right) + H_{12}\, p_2^{[\mu} p_1^{\nu]}$$

CM Frame

$$\left.\frac{J^{12}_{\rm CM}}{\mathrm{J}_{\rm CM}}\right|_{\omega=0} = G_1 + G_2$$

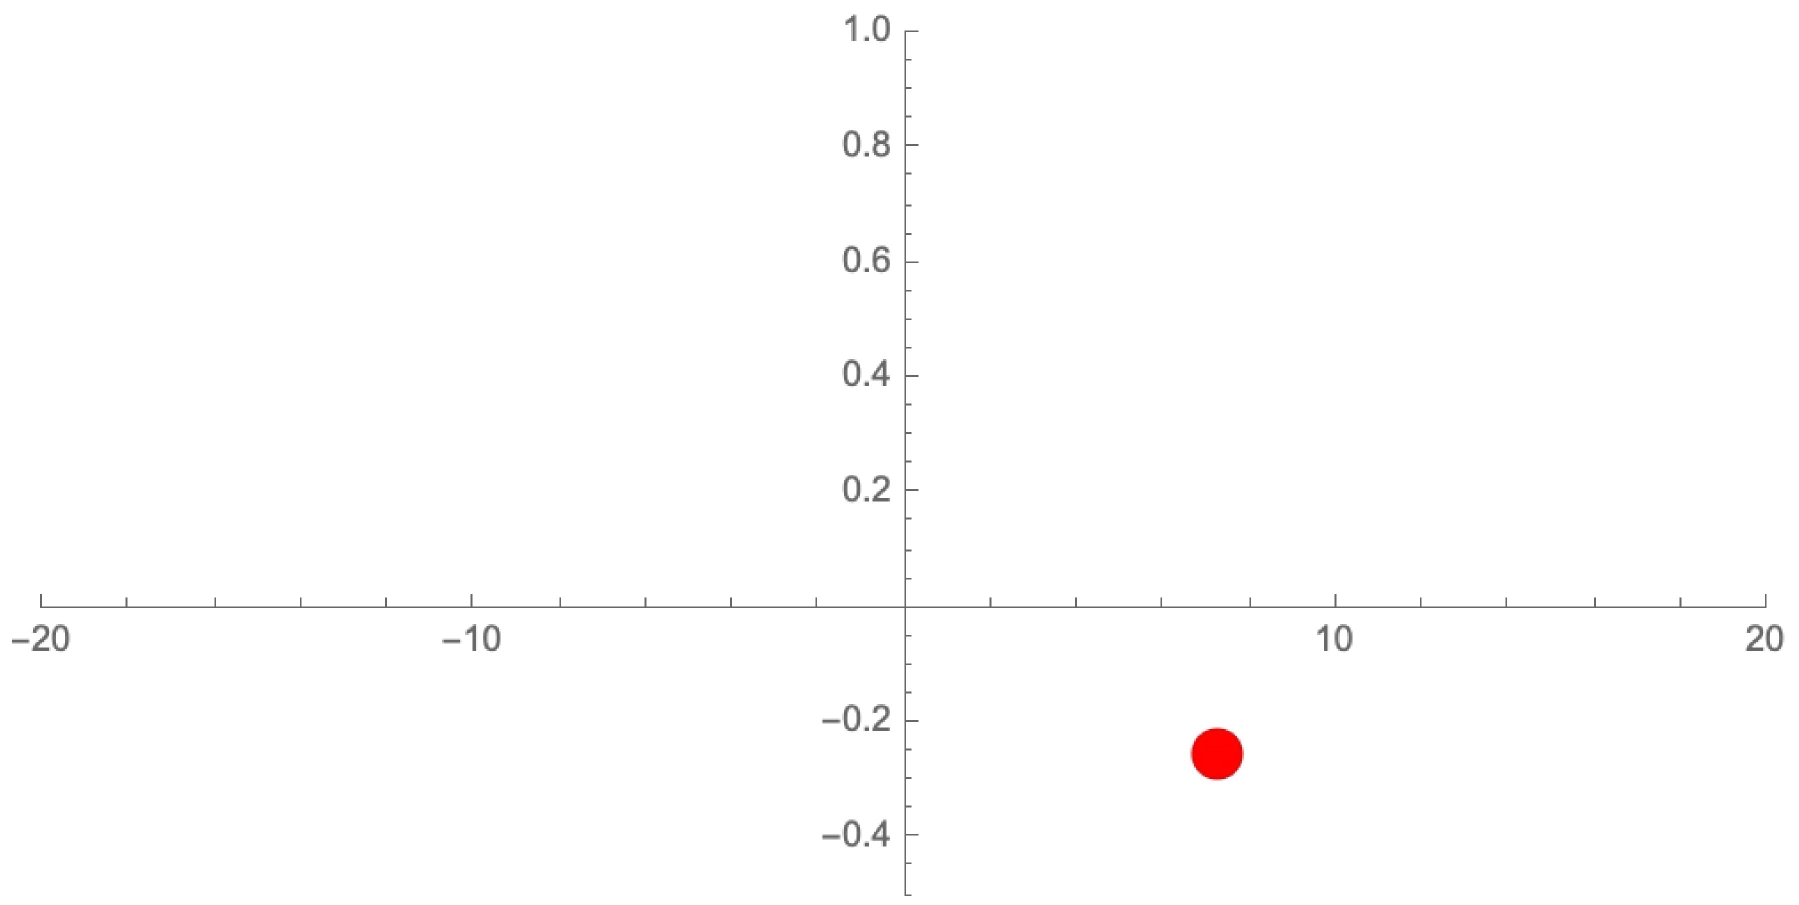
Rest Frame

$$\left.\frac{J^{12}_{\rm rest}}{\mathrm{J}_{\rm rest}}\right|_{\omega=0} = G_2$$

- Since $G_1 = G_2$ at leading order, our answer agrees with this general prediction

Crosscheck with Burke-Throne

- Burke-Throne force at G^2: $\mathbf{a_1} = -\mathbf{a_2} = \frac{4G^2 m_1 m_2}{5r^3}\left(3v^2 v_r \hat{\mathbf{r}} - v^2 \mathbf{v}\right)$

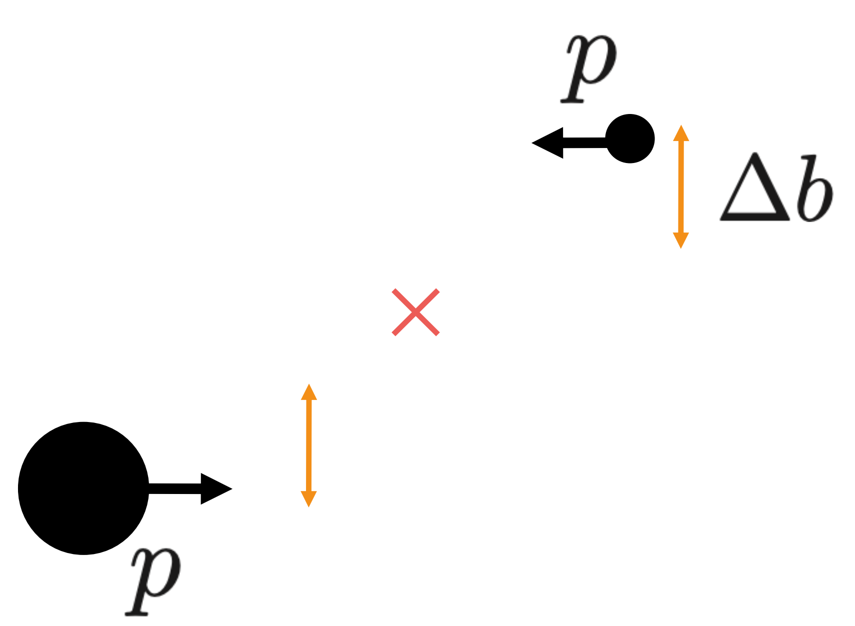


- Final energy is the same as initial
- Impact parameter shrinks equally
- Non-decoupling of heavy particle

Crosscheck with Burke-Throne

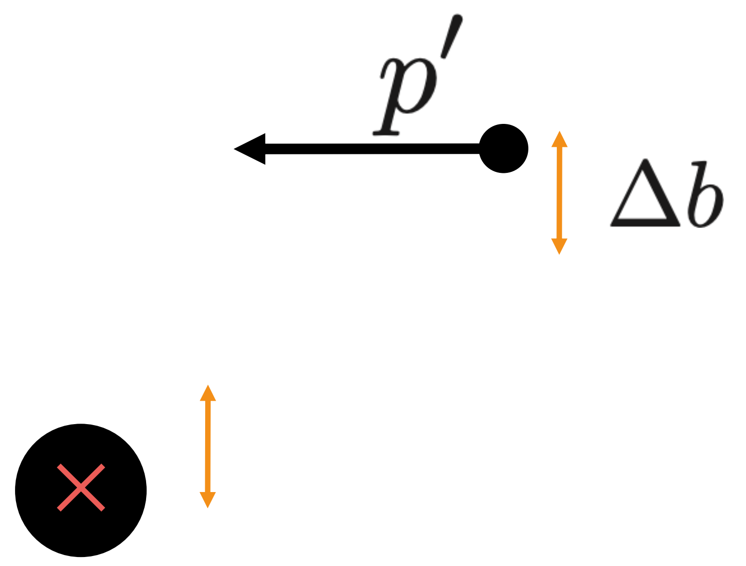
- Burke-Throne force at G^2: $\mathbf{a_1} = -\mathbf{a_2} = \dfrac{4G^2 m_1 m_2}{5r^3}\left(3v^2 v_r \hat{\mathbf{r}} - v^2 \mathbf{v}\right)$

CM Frame:



$$\frac{J^{12}_{\mathrm{CM},2}}{\mathrm{J}_{\mathrm{CM}}} = \frac{2p\Delta b}{pb} = 2 \times \frac{\Delta b}{b}$$

Rest Frame:



$$\frac{J^{12}_{\mathrm{rest},2}}{\mathrm{J}_{\mathrm{rest}}} = \frac{p'\Delta b}{p'b} = \frac{\Delta b}{b}$$

Non-decoupling of heavy particle. Back reaction is important!

$$J^{\mu\nu} = 8\pi G \int \widetilde{dk} \left(\mathcal{T}^{*\rho\sigma}(k) \mathcal{L}^{\mu\nu} \mathcal{T}_{\rho\sigma}(k) - \frac{\mathcal{T}_{\rho}^{*\rho}(k) \mathcal{L}^{\mu\nu} \mathcal{T}_{\sigma}^{\sigma}(k)}{D-2} + 2i\, \mathcal{T}^{*\rho[\mu}(k) \mathcal{T}^{\nu]}{}_{\rho}(k) \right)$$

Our formula agrees with covariance and Burke-Throne force

Standard formula is incomplete for scattering because of the presence of soft mode

Precision Frontier:

Radiated angular momentum at G^3

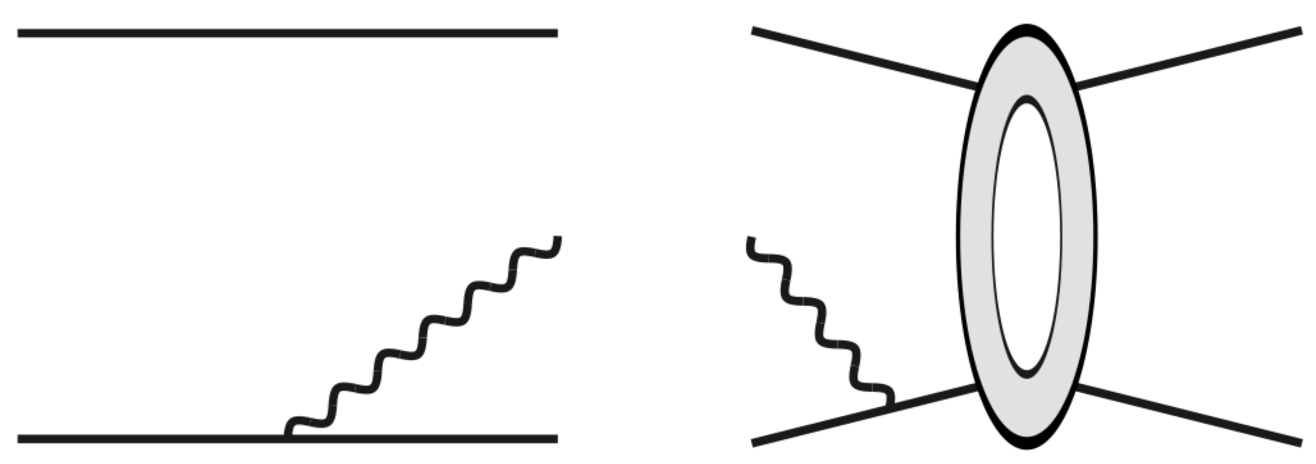
Radiated Poincare Charges

- State of the art precision at G^3

$P^\mu \to$ Known [Herrmann, Parra-Martinez, Ruf, Zeng]

$J^{\mu\nu} \to$ Both zero and finite frequency contributions

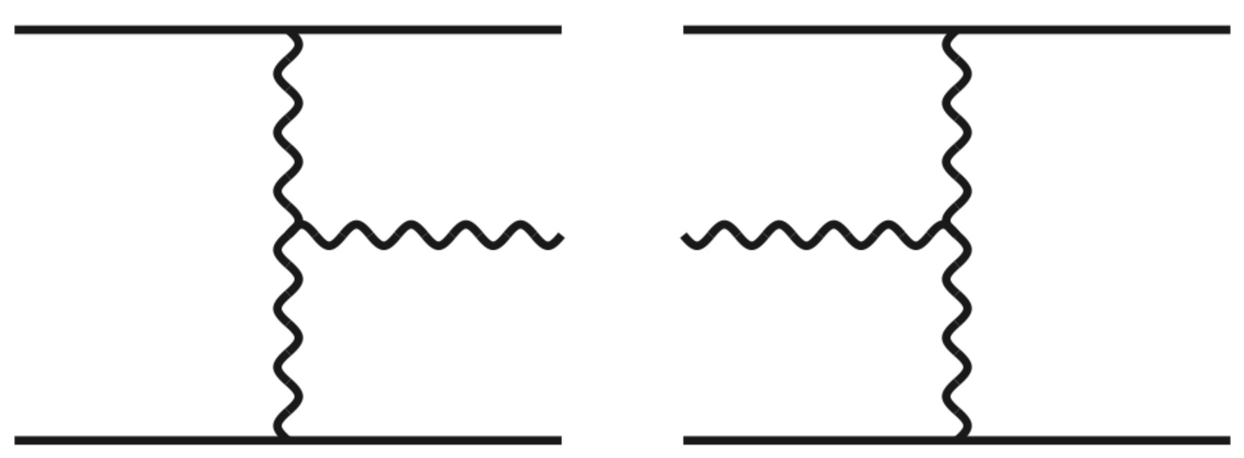
Soft Theorem



- Same as before, just use G^2 impulses

[Westpfahl 80's]

Double Copy & Generalized Unitarity



- Waveform from 2-to-3 amplitude via KMOC

- Resum velocity expansion from $O(v^{60})$ series

[See Carlos Heissenberg's poster]

New Results in General Relativity

- New results for G^3 radiated angular momentum

$$\frac{J_3}{\pi} = \frac{28}{5}p_\infty^2 + \left(\frac{739}{84} - \frac{163}{15}\nu\right)p_\infty^4 + \left(-\frac{5777}{2520} - \frac{5339}{420}\nu + \frac{50}{3}\nu^2\right)p_\infty^6$$

[Bini, Damour, Geralico ’21]

$$+ \left(\frac{115769}{126720} + \frac{1469}{504}\nu + \frac{9235}{672}\nu^2 - \frac{553}{24}\nu^3\right)p_\infty^8 + \dots$$

[Manohar, Ridgway, **CHS**]

$$\mathcal{I}(\sigma) = -\frac{16}{3} + \frac{2\sigma^2}{\sigma^2-1} + \frac{(2\sigma^2-3)}{\sigma^2-1}\frac{\sigma \operatorname{arcsinh}\left(\sqrt{\frac{\sigma-1}{2}}\right)}{\sqrt{\sigma^2-1}}$$

$$\frac{\mathcal{E}(\sigma)}{\pi} = f_1 + f_2 \log\left(\frac{\sigma+1}{2}\right) + f_3\frac{\sigma \operatorname{arcsinh}\left(\sqrt{\frac{\sigma-1}{2}}\right)}{\sqrt{\sigma^2-1}}$$

$$\frac{\mathcal{C}(\sigma)}{\pi} = g_1 + g_2 \log\left(\frac{\sigma+1}{2}\right) + g_3\frac{\sigma \operatorname{arcsinh}\left(\sqrt{\frac{\sigma-1}{2}}\right)}{\sqrt{\sigma^2-1}}$$

$$\mathcal{D}(\sigma) = \frac{3\pi(5\sigma^2-1)}{8}\mathcal{I}(\sigma)$$

$$f_1 = \frac{210\sigma^6 - 552\sigma^5 + 339\sigma^4 - 912\sigma^3 + 3148\sigma^2 - 3336\sigma + 1151}{48(\sigma^2-1)^{3/2}}$$

$$f_2 = -\frac{35\sigma^4 + 60\sigma^3 - 150\sigma^2 + 76\sigma - 5}{8\sqrt{\sigma^2-1}}$$

$$f_3 = \frac{(2\sigma^2-3)(35\sigma^4 - 30\sigma^2 + 11)}{8(\sigma^2-1)^{3/2}}$$

$$g_1 = \frac{105\sigma^7 - 411\sigma^6 + 240\sigma^5 + 537\sigma^4 - 683\sigma^3 + 111\sigma^2 + 386\sigma - 237}{24(\sigma^2-1)^2}$$

$$g_2 = \frac{35\sigma^5 - 90\sigma^4 - 70\sigma^3 + 16\sigma^2 + 155\sigma - 62}{4(\sigma^2-1)}$$

$$g_3 = \frac{-(2\sigma^2-3)(35\sigma^5 - 60\sigma^4 - 70\sigma^3 + 72\sigma^2 + 19\sigma - 12)}{4(\sigma^2-1)^2}$$

2.5PN **3.5PN** **4.5PN**

$$(v^3 + v^5 + v^7 + v^9 + \dots) \quad G^2$$

$$(v + v^3 + v^5 + v^7 + \dots) \quad G^3$$

$$(v + v^3 + v^5 + \dots) \quad G^4$$

Applications: impulses at G^4

- Predict for G^4 odd-in-v impulses [Bini, Damour, Geralico]

$$\Delta p_{\perp,4} = \nu M^5 \left(\frac{G}{b}\right)^4 \left(c_{b,4}^{\text{cons}} + c_{b,4}^{\text{rr,even}} + c_{b,4}^{\text{rr,odd}}\right)$$

Conservative; even in v — [Bern, Parra-Martinez, Roiban, Ruf, **CHS**, Solon, Zeng, '21] [Dlapa, Kalin, Liu, Porto '21]

Dissipative; even in v — Unknown!!

Dissipative; odd in v — [Manohar, Ridgway, **CHS** '22]

- Simplify a G^4 problem into mostly leading order inputs via **factorizations in EFT** [Bini, Damour]

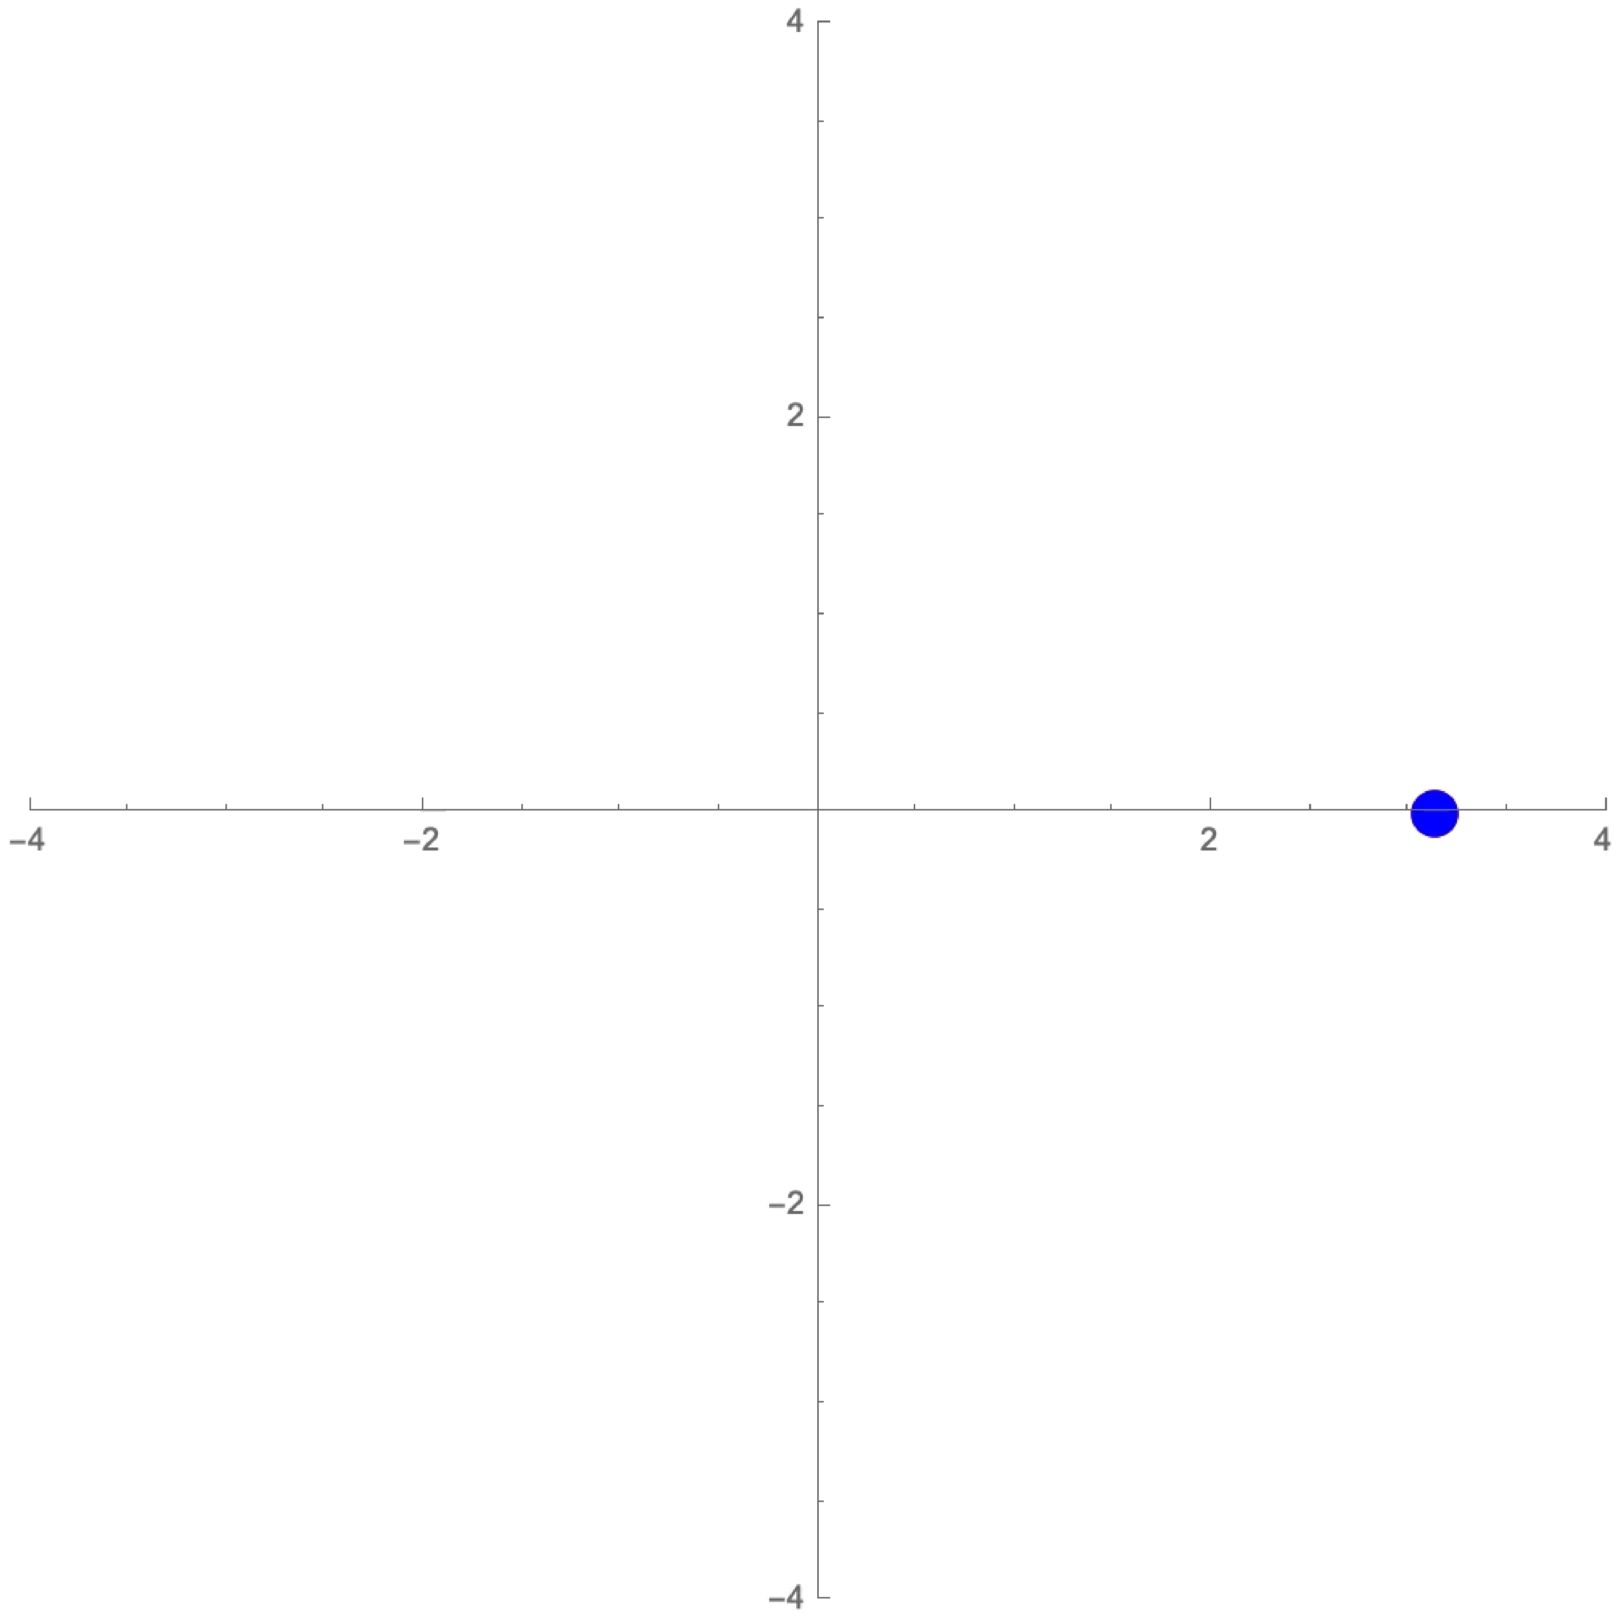
$$2\chi^{\text{rr}} = \frac{\partial \chi^{\text{cons}}}{\partial J}\Delta J + \frac{\partial \chi^{\text{cons}}}{\partial E}\Delta E$$

Precision Binary Dynamics

m1=m2, G=0.01, E[0]=–0.0176, J[0]=0.4, v[0]=0.128

t = 0.0

{E,J} = {–0.0176, 0.400}



$$\dot{\boldsymbol{x}} = \frac{\partial H}{\partial \boldsymbol{p}}$$

$$\dot{\boldsymbol{p}} = -\frac{\partial H}{\partial \boldsymbol{x}} + \boldsymbol{F}_{\mathrm{RR}}$$

Conservative

All orders in v to $\mathbf{G}^4$

from the scattering angle

[Bern, Cheung, Roiban, **CHS**, Solon, Zeng, '19]

[Bern, Parra-Martinez, Roiban, Ruf, **CHS**, Solon, Zeng, '21]

[Dlapa, Kalin, Liu, Porto '21]

Dissipative

All orders in v to $\mathbf{G}^3$

from radiated E and J

[Manohar, Ridgway, **CHS** '22]

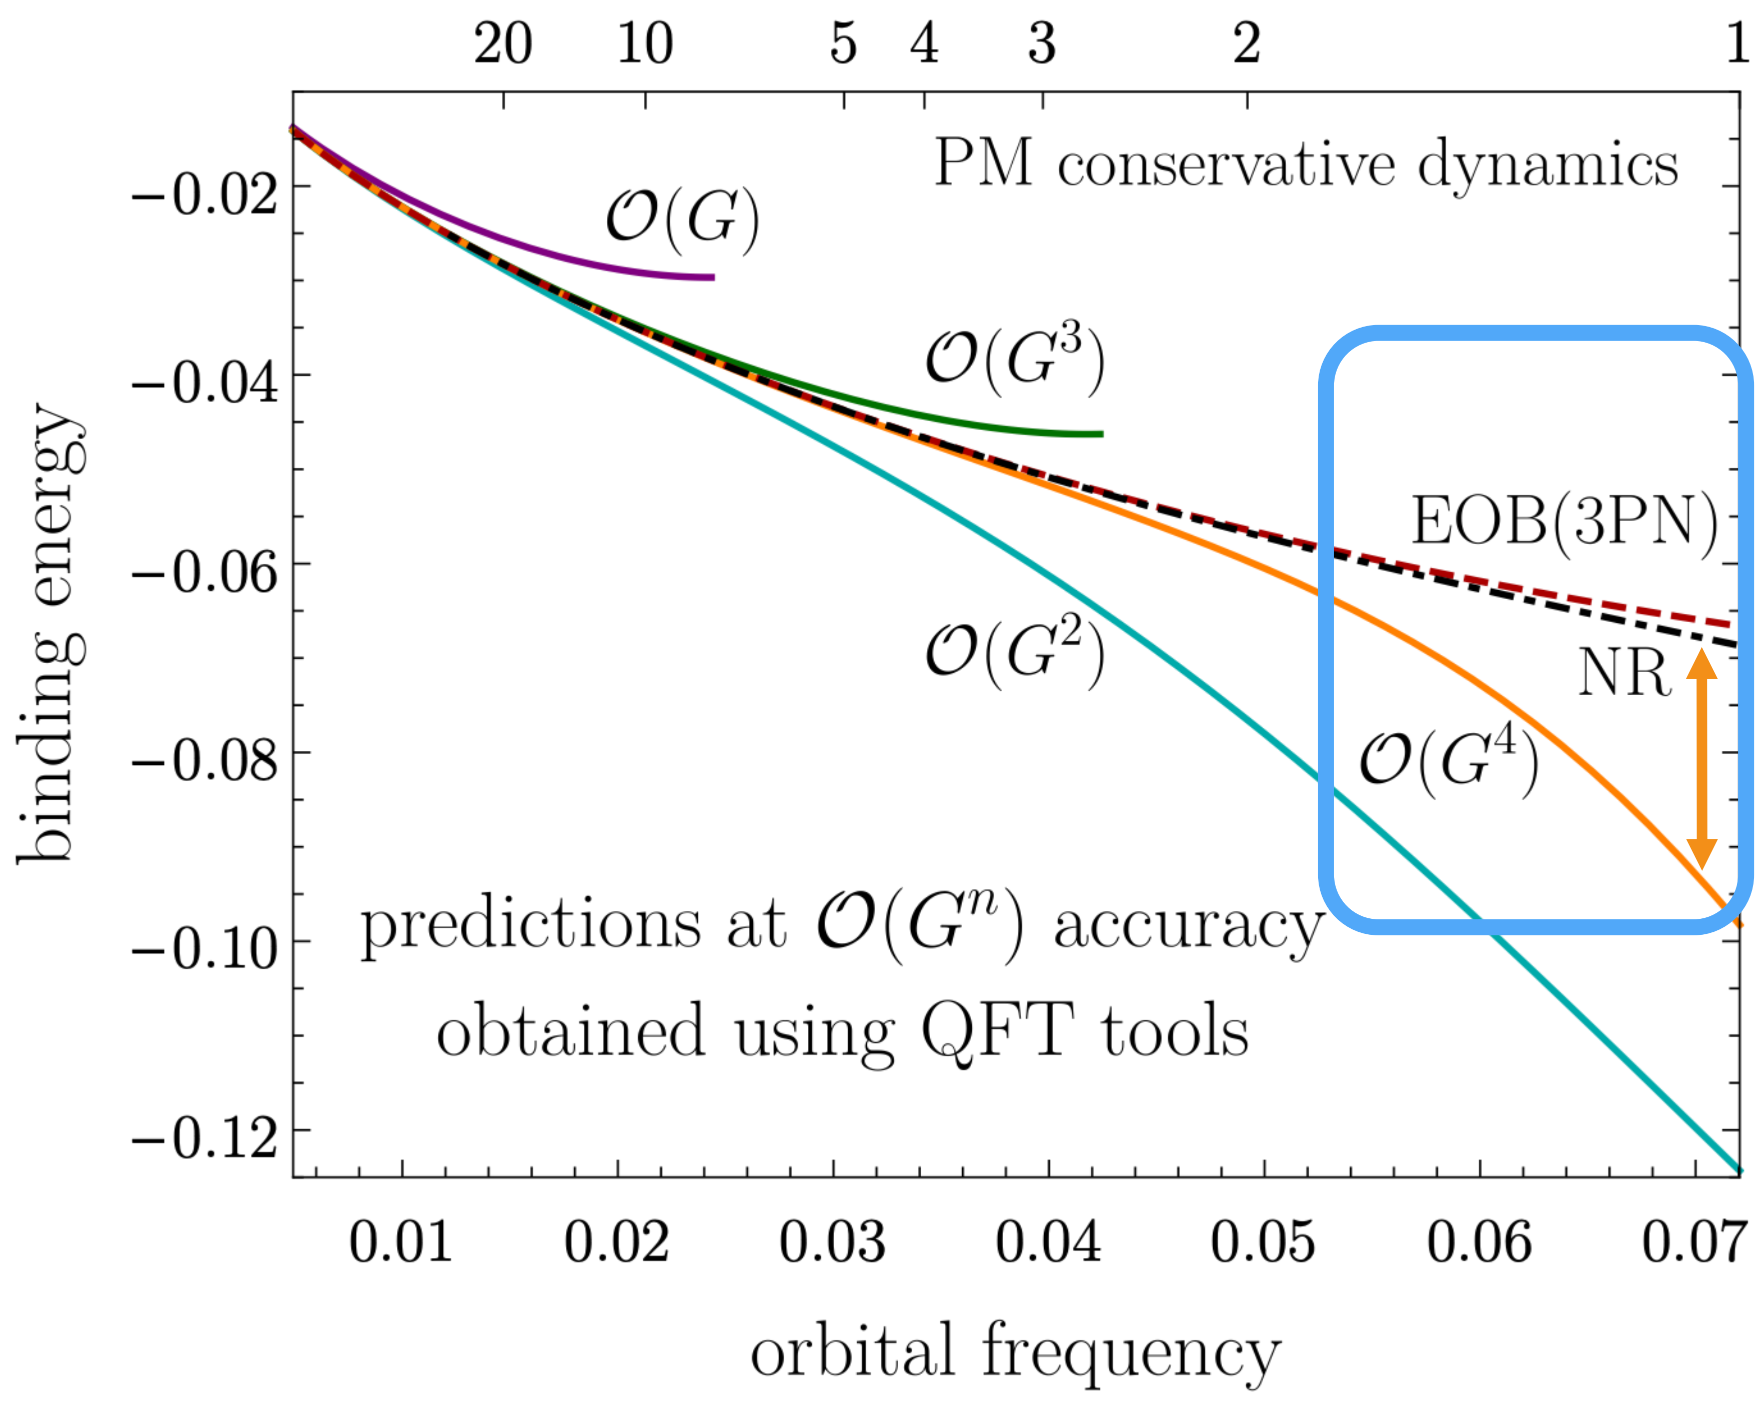
*Caveat: illustration only

Don't trust a plot made by theorists

Precision Binary Dynamics

Only conservative effect included in PM so far

Can dissipation bring closer to numerical data?



Snowmass white paper [Buonanno, Khalil, O'Connell, Roiban, Solon, Zeng, 2204.05194]
[Khalil, Buonanno, Steinhoff, Vines, 2204.05047]

Summary & Outlook

- **Symmetries** are powerful
- **State-of-the-art dissipative force in GR purely from YM**
- New **formulae, perturbative and non-perturbative** results of **angular momentum**
- **Higher order** dissipative effects?
  - Interesting functions & Tail effect. Mapping to bound states?
- Applications of angular momentum in **particle physics**?

Thank you

Common concerns

- Can zero-energy radiation carries angular momentum? **Yes**
- Is radiated angular momentum infrared finite
  (due to 1/r potential in 4D)? **Yes**
- Are distribution functions (e.g. delta functions) well-defined? **Yes**

All of above can be answered in scalar theory

- Is there BMS ambiguity on angular momentum? **Maybe, I don’t know**
  - But need to explain the match to ALD force in electromagnetism
  - Need to explain the match to Burke-Throne force in GR
