

MicroBooNE's Low Energy Excess Search: First Results and Future Prospects

Mark Ross-Lonergan

on behalf of the MicroBooNE Collaboration

Snowmass BSM@nu Workshop

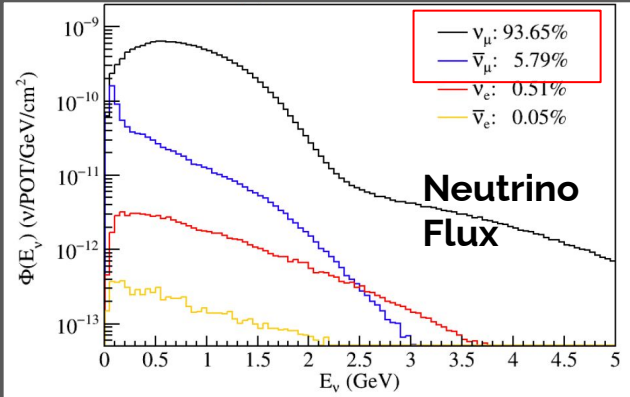

February 11th 2022

The MicroBooNE logo features the text "μBooNE" in a white serif font, with the Greek letter mu (μ) as a subscript. The text is enclosed within a thin, light gray oval border.

Introduction to MicroBooNE and Booster Neutrino Beam (BNB) at Fermilab

Introduction to MicroBooNE and Booster Neutrino Beam (BNB) at Fermilab

Introduction to MiniBooNE and MicroBooNE (MB) at Fermilab

MiniBooNE!

MicroBooNE!

MiniBooNE Low-Energy Excess (LEE)

MiniBooNE was designed to look for

MiniBooNE observed an excess of
electron like-events

Its **significance** is now **4.8σ** (systematics limited)
when combining all neutrino and antineutrino
beam data.

Electrons

Electron Cherenkov ring event in MiniBooNE

Electrons produced in charged current (ν_e) interactions were detected by their Cherenkov ring

Electrons or Photons?

Electron Cherenkov ring event in MiniBooNE

MiniBooNE couldn't separate electrons from photons.

Electrons produced in charged current (ν_e) interactions were detected by their Cherenkov ring

However, **photons**, that pair produce extremely collimated electron/positron pairs produced an identical Cherenkov ring

Electrons or Photons?

Electron Cherenkov ring event in MiniBooNE

MiniBooNE couldn't separate electrons from photons.

What really is happening in MiniBooNE?!

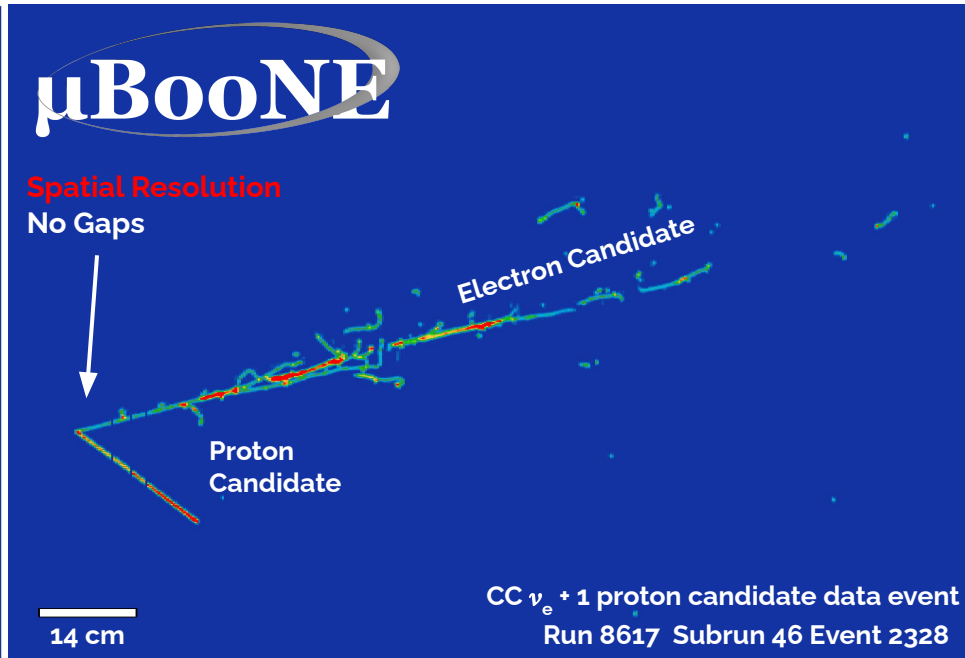

Photons or Electrons

Electron / Photon Separation in MicroBooNE

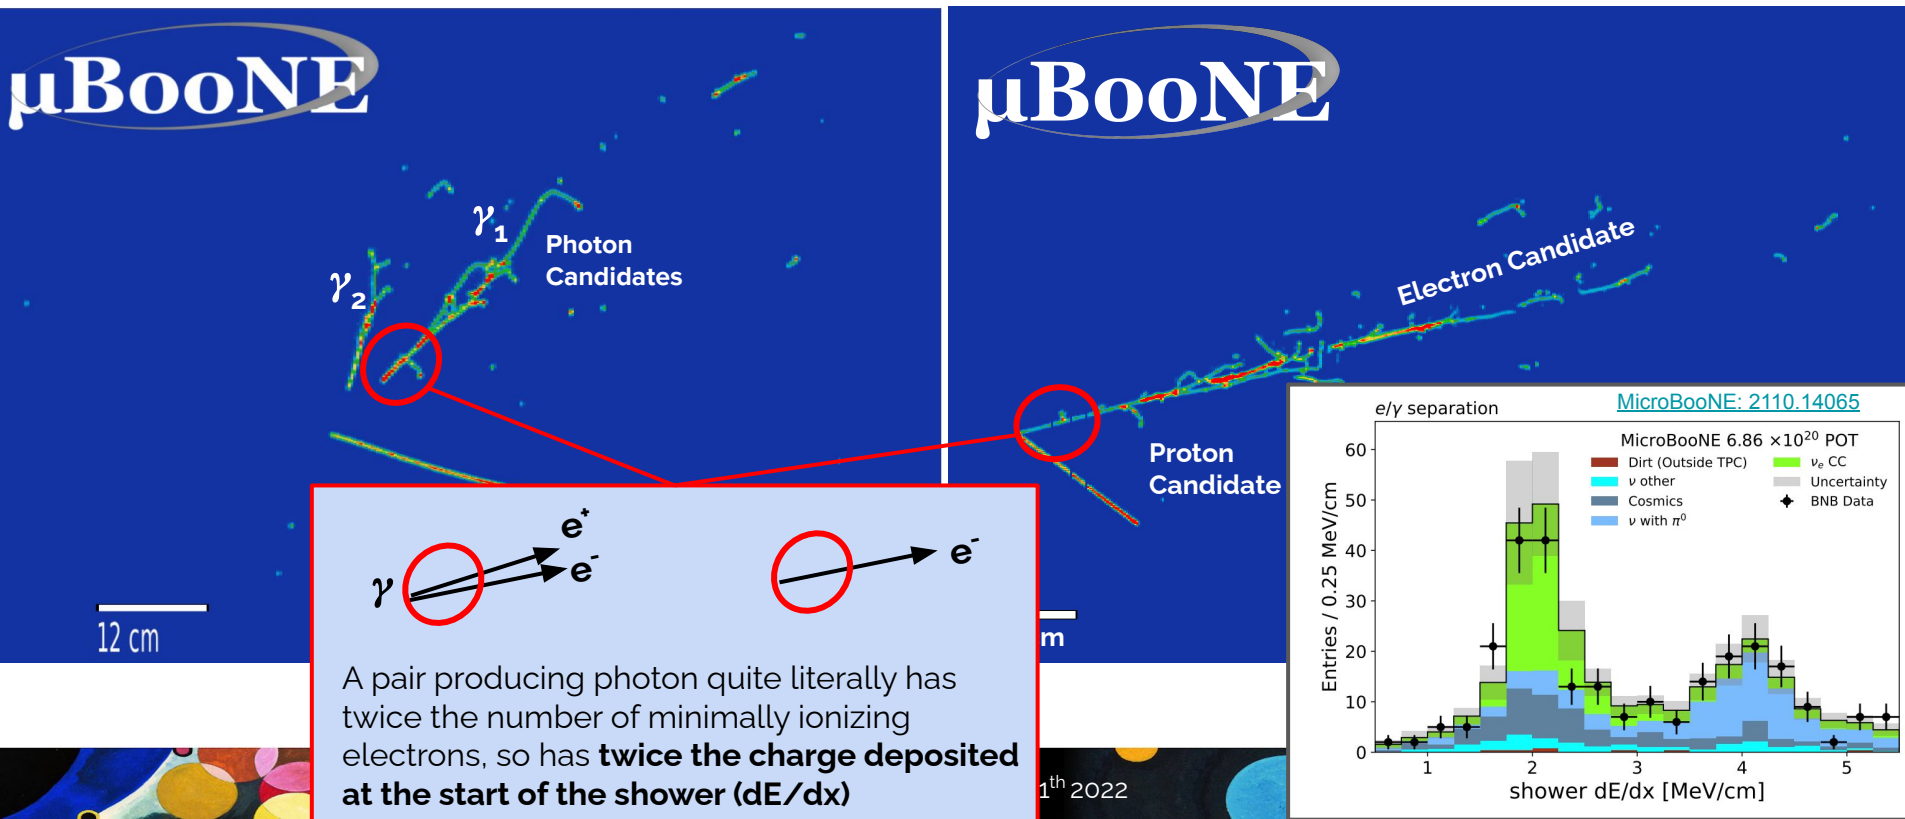

LArTPC's can separate **photons** from **electrons**
due to **fine spatial resolution** and calorimetry

Electron / Photon Separation in MicroBooNE

LArTPC's can separate **photons** from **electrons**
due to fine spatial resolution and **calorimetry**

Searching for Photons

Neutral Current Δ Radiative Decay ($\text{NC } \Delta \rightarrow \text{N}\gamma$)

First MicroBooNE photon search targeted Neutral Current Δ Radiative Decay ($\text{NC } \Delta \rightarrow \text{N}\gamma$), a standard model source of lone photons that has **never been directly observed in the neutrino sector** before.

Shape of expected events very close to that of the MiniBooNE Low-Energy Excess.

A x3.18 enhancement could explain the excess. ([Phys. Rev. D 103, 052002 \(2021\)](https://arxiv.org/abs/2110.14065))

For more info See Single-Photon Paper,
submitted to PRL: <https://arxiv.org/abs/2110.14065>

Target two distinct topologies

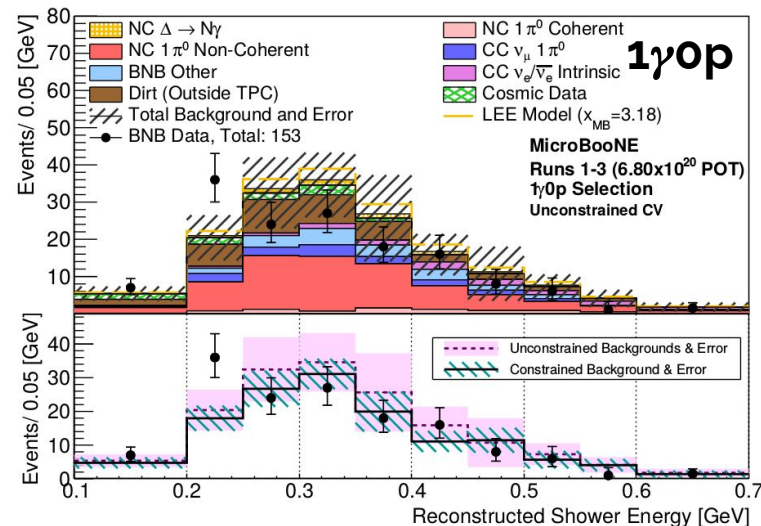

Developed analyses targeting two topologies containing a **single-photon like shower** and either **1 or 0 proton tracks**

Two distinct topologies

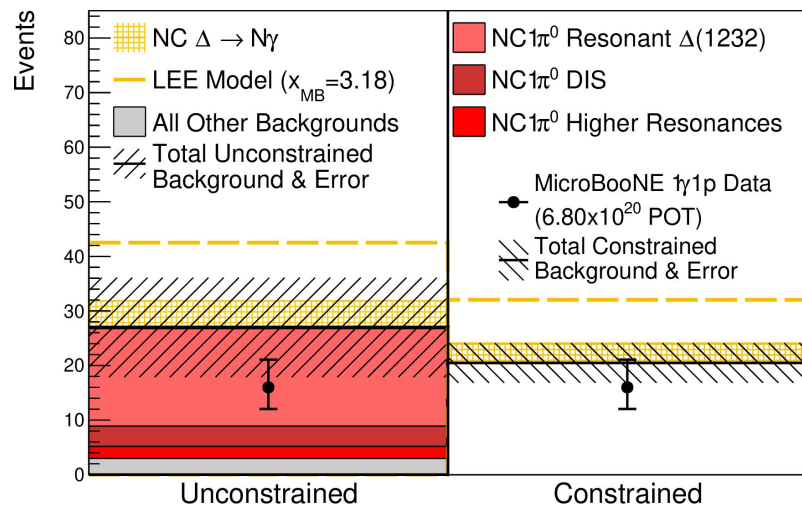

Developed analyses targeting two topologies containing a **single-photon like shower** and either **1 or 0** proton tracks

One-bin counting experiment

$1\gamma 1p$

$1\gamma 1p$

Unconstr. bkgd.	27.0 ± 8.1
Constr. bkgd.	20.5 ± 3.6
NC $\Delta \rightarrow N\gamma$	+ 4.88
LEE ($x_{MB} = 3.18$)	+ 15.5

16
Data Events
Observed

- We see **no evidence** for an enhanced rate of single-photons from **NC $\Delta \rightarrow N\gamma$ decay**, above nominal expectations
- Under a two-hypothesis test, the data disfavours the interpretation of the MiniBooNE anomalous excess as a factor of 3.18 enhancement to the rate NC $\Delta \rightarrow N\gamma$, in favor of the nominal prediction at **94.8% CL**
- Majority of the sensitivity of this comes from the $1\gamma 1p$ selection, $1\gamma 0p$ less constrained

Searching for Electrons

MicroBooNE's First electron searches

MicroBooNE has recently released the results of **three separate analyses** that target looking for **electrons from ν_e** in the BNB

- Charged Current **Inclusive ν_e** measurement ([hep-ex:2110.13978](https://arxiv.org/abs/hep-ex/2110.13978))
- Charged Current **Pion-less ν_e** measurement ([hep-ex:2110.14065](https://arxiv.org/abs/hep-ex/2110.14065))
- Charged Current **Quasi Elastic ν_e** measurement ([hep-ex:2110.14080](https://arxiv.org/abs/hep-ex/2110.14080))

MicroBooNE's First electron searches

MicroBooNE has recently released the results of **three separate analyses** that target looking for **electrons from ν_e** in the BNB

- Charged Current **Inclusive ν_e** measurement ([hep-ex:2110.13978](https://arxiv.org/abs/hep-ex/2110.13978))
- Charged Current **Pion-less ν_e** measurement ([hep-ex:2110.14065](https://arxiv.org/abs/hep-ex/2110.14065))
- Charged Current **Quasi Elastic ν_e** measurement ([hep-ex:2110.14080](https://arxiv.org/abs/hep-ex/2110.14080))

All three use different and complementary **LArTPC reconstruction techniques** and focus on different final states

Wire-Cell 3D tomography reconstruction ([2110.13961](https://arxiv.org/abs/2110.13961))

Pandora pattern recognition reconstruction ([2110.14065](https://arxiv.org/abs/2110.14065))

Imaged based **Deep-Learning** reconstruction ([2110.14080](https://arxiv.org/abs/2110.14080))

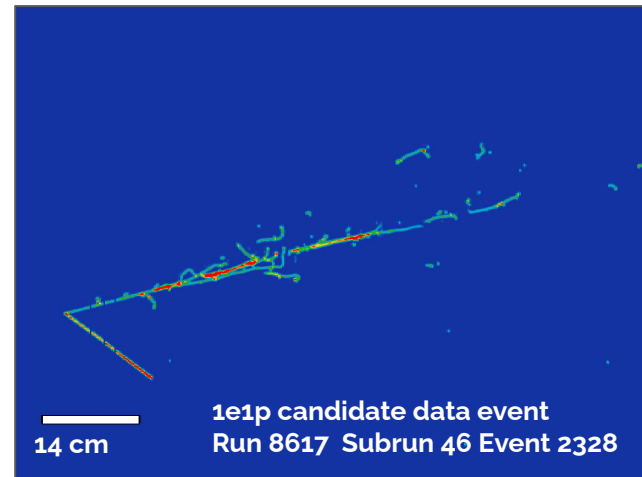

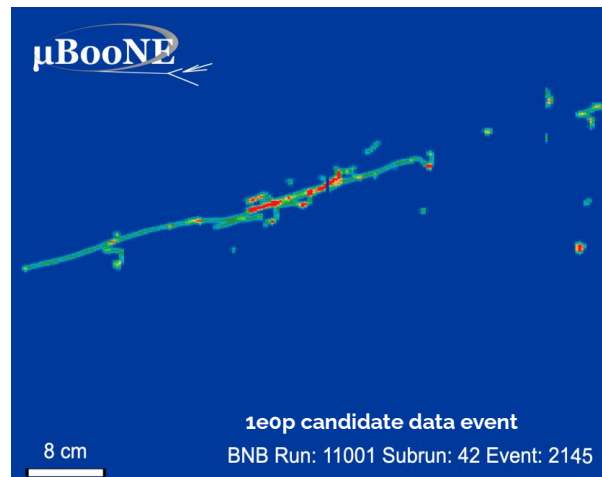

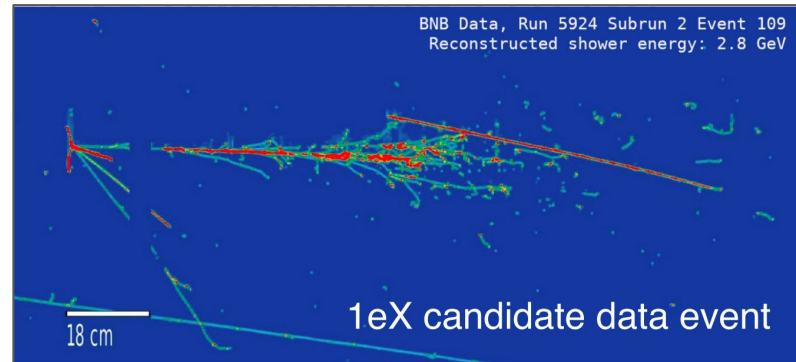

MicroBooNE's First electron searches

- Charged Current **Inclusive** ν_e measurement ([hep-ex:2110.13978](https://arxiv.org/abs/hep-ex/2110.13978))

Topology agnostic

Just looking for electron-like showers, regardless of NY other mesons or hadrons.

High Efficiency,
High Statistics and
high purity selection

Inclusive ν_e Results

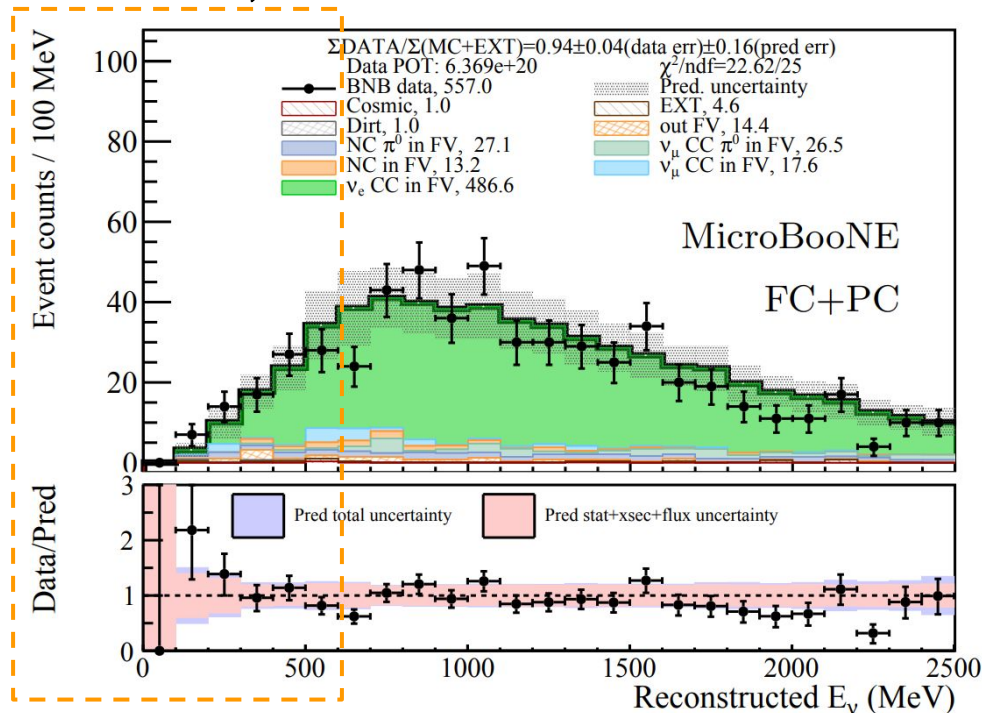

The **Signal region** is where we would expect to see the **Low-Energy Excess** if it were due to an increased rate of intrinsic- ν_e

Good agreement within assigned systematic uncertainties is observed across entire energy range with $\chi^2/\text{ndof} = 22.62/25$

CC ν_e purity of 82%

CC ν_e selection efficiency of 46%

Signal region defined as
reconstructed $E_\nu < 600$ MeV

MicroBooNE [hep-ex:2110.13978](https://arxiv.org/abs/hep-ex/2110.13978)

Inclusive ν_e Results

Restrict ourselves to subset of well-reconstructed, **fully contained** events

In the **Signal region** Observed **56** events

And predicted

- 69.6 ± 5.0 (sys) ± 8.0 (stat) events
 - (No LEE hypothesis)
- 103.8 ± 7.4 (sys) ± 9.0 (stat) events
 - (with a simple LEE model)

No excess of low energy ν_e candidates is observed

Signal region defined as
reconstructed $E_\nu < 600$ MeV

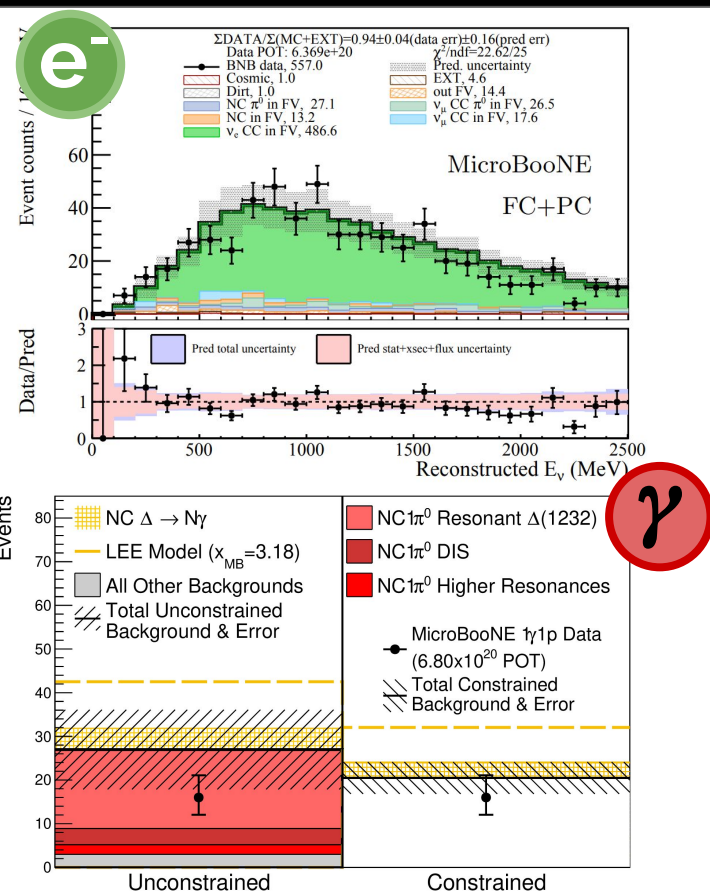

First Series of MicroBooNE Results

While these results **strongly disfavour** the possibility of the MiniBooNE low-energy excess being entirely due to an **increased ν_e rate** or enhanced **single-photons from NC $\Delta \rightarrow N\gamma$** decays they don't change the fact that **MiniBooNE saw an anomaly!**

With these first tests, leveraging the power of **LArTPC neutrino detector** technology, we have begun to **eliminate avenues**, but plenty remain..

Future Prospects

Electrons or Photons? ... or e^+e^- pairs?

Overlapping e^+e^-

Highly Asymmetric e^+e^-

Rich phenomenology developing in recent years around the possibility of the MiniBooNE excess being due to e^+e^- pairs from **decays of new exotic particles** such as **dark-photons, axion-like particles or new scalars!**

If sufficiently overlapping these can mimic the MiniBooNE electron-like signal

Bertuzzo et al, PRL 121, 241801 (2018)

Evolving Theory Landscape

 - Chang, Chen, Ho, Tseng, *Phys. Rev. D* 104, 015030 (2021)

(Caution: not an exhaustive list!)

The hadronic side of things

Many of these models predict widely varying **hadronic activity** alongside the e^- , γ or e^+e^- needed to explain the anomaly.

To MiniBooNE all of these look identical, as they couldn't see **protons** below cherenkov threshold

No
hadronic
activity

Hadronic
activity at shower
start

Displaced vertex

Displaced
vertex +
not-pointing

The **hadronic final state topologies** can give us a handle to separate out these models!

Summary

MicroBooNE's first results have demonstrated that by leveraging LArTPC technology we can perform detailed measurements capable of both **separating electron from photons** and delving into the **hadronic reconstruction** opening the door for potentially distinguishing between a wide range of BSM theories.
