

Ground-breaking ceremony for the High-

Luminosity LHC

by Corinne Pralavorio

The earthmovers are at work on the ATLAS site in Meyrin and at CMS in Cessy, digging the new shafts for the High-Luminosity LHC (HL-LHC). The start of the work for this new phase of the project was marked by a ceremony held on 15 June, which was attended by VIP guests including the President of the State Council of the Republic and Canton of Geneva, the Prefect of the Rhône-Alpes-Auvergne region, the Mayor of Meyrin, the Deputy Mayor of Cessy and representatives of CERN's Member and Associate Member States.

"All the chapters of CERN's history have begun with a shovel of earth, and each chapter has begun with the promise of great progress in fundamental knowledge, new technologies that benefit society, and collaboration on a European and now a global scale. This was true of the Large Hadron Collider (LHC) and its experiments and it is true of the project for which we are gathered here today," said Fabiola Gianotti, CERN Director-General.

Software and computing

Time to adapt for big data

Radical changes in computing and software are required to ensure the success of the LHC and other high-energy physics experiments into the 2020s, argues a new report.

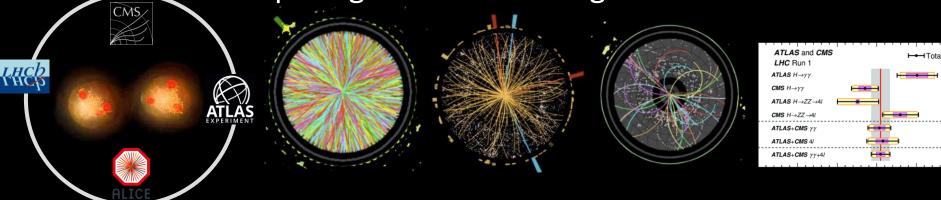

It would be impossible for anyone to conceive of carrying out a particle-physics experiment today without the use of computers and software. Since the 1960s, high-energy physicists have pioneered the use of computers for data acquisition, simulation and analysis. This hasn't just accelerated progress in the field, but driven computing technology generally - from the development of the World Wide Web at CERN to the massive distributed resources of the Worldwide LHC Computing Grid (WLCG) that supports the LHC experiments. For many years these developments and the increasing complexity of data analysis rode a wave of hardware improvements that saw computers get faster every year. However, those blissful days of relying on Moore's law are now well behind us (see panel overleaf), and this has major ramifications for our field.

The high-luminosity upgrade of the LHC (HL-LHC), due to enter operation in the mid-2020s, will push the frontiers of accelerator and detector technology, bringing enormous challenges to software and computing (CERN Courier October 2017 p5). The scale of the HL-LHC data challenge is staggering: the machine will collect almost 25 times more data than the LHC has produced up to now, and the total LHC dataset (which already stands at almost 1 exabyte) will grow many times larger. If the LHC's ATLAS and CMS experiments project their current computing models to Run 4 of the LHC in 2026, the CPU and disk space required will jump by between a factor of 20 to 40 (figures 1 and 2).

Even with optimistic projections of technological improvements there would be a huge shortfall in computing resources. The WLCG hardware budget is already around 100 million Swiss francs per year and, given the changing nature of computing hardware and slowing technological gains, it is out of the question to simply throw

Computing at CERN: The Big Picture

Data Storage

- Data Processing

- Event generation

- Detector simulation

- Event reconstruction

- Resource accounting

Distributed computing

- Middleware

- Workload management

- Data management

- Monitoring

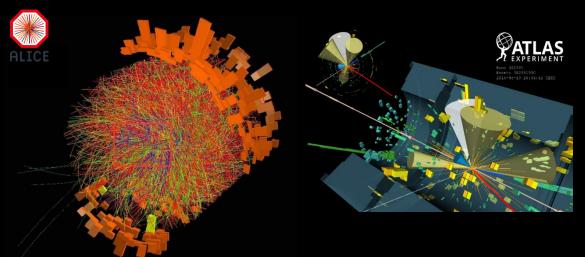

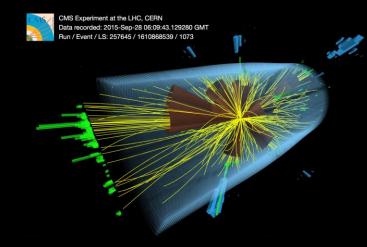

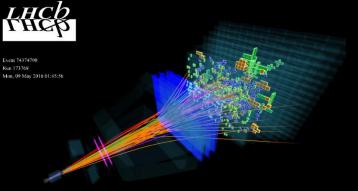

From the Hit to the Bit: Data Acquisition

100 million channels40 million pictures a secondSynchronised signals from all detector parts

From the Hit to the Bit: Event Filtering

L1: 40 million events per second

Fast, simple information

Hardware trigger in a few micro seconds

L2: 100,000 events per second

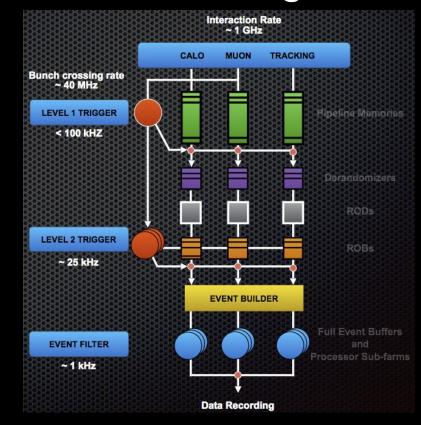

Fast algorithms in local computer farm

Software trigger in <1 second

Which OS for such task?

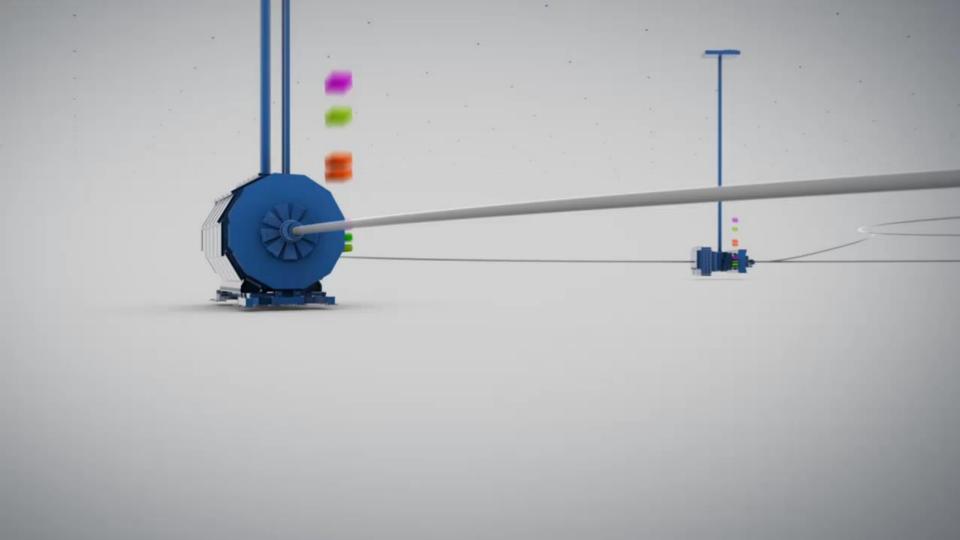

EF: Few 1000s per second recorded for offline analysis

By each experiment!

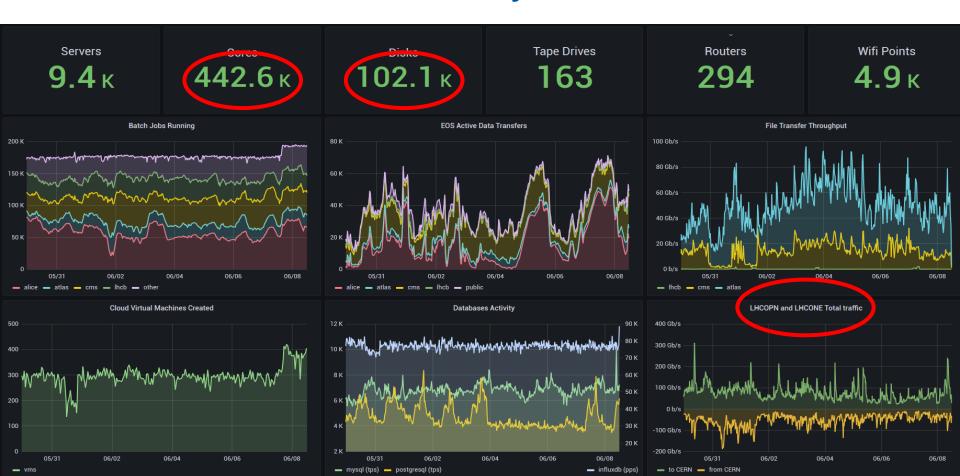

The CERN Data Centre

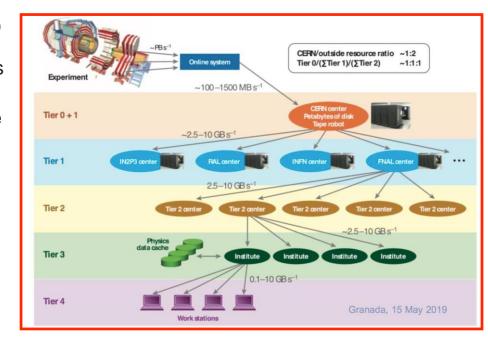

CERN DC: an ordinary week in numbers

The Worldwide LHC Computing Grid

- The Worldwide LHC Computing Grid (WLCG) is a global collaboration of more than 170 data centres around the world, in 42 countries
- The CERN data centre (Tier-0) distributes the LHC data worldwide to the other WLCG sites (Tier-1 and Tier-2)
- WLCG provides global computing resources to store, distribute and analyse the LHC data
 - CERN = only 15% of CPU resources
 - Distributed funding
 - "Sociological" reasons

Data Distribution in WLCG

- Global transfer rates regularly exceeding
 60 GB/s
- 830 PB and 1.1B files transferred until end of LHC Run 2 (2010-2018)
- Main challenge is to have the useful data close to available computing resources

=> match storage/compute/network

Running jobs: 365644 Active CPU cores: 807139 Transfer rate: 21.54 GiB/sec

Software Platforms for HEP

- Home made solutions vs. integrating software platforms from the (open source) market
 - Infrastructure moving towards the latter as industry grew in front of us!

Software Platforms for HEP

- Home made solutions vs. integrating software platforms from the (open source) market
 - Infrastructure moving towards the latter as industry grew in front of us!

 Yet, high-level storage software customized for our specific access patterns

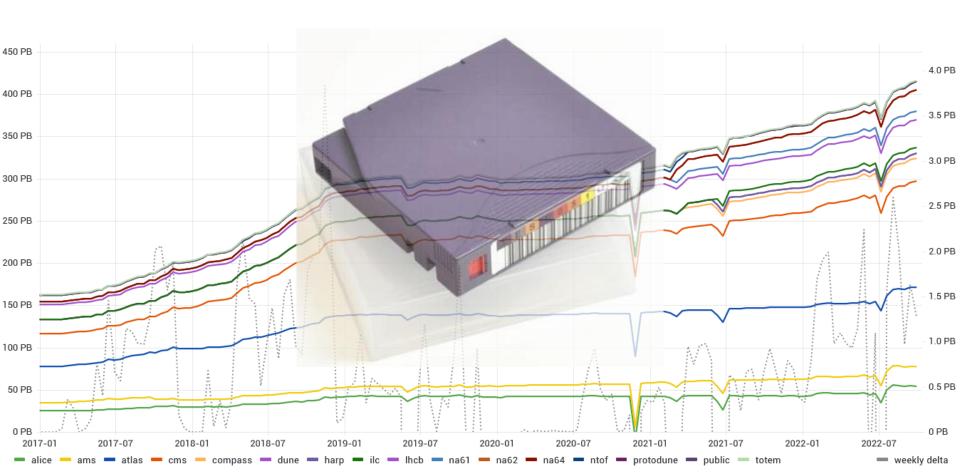

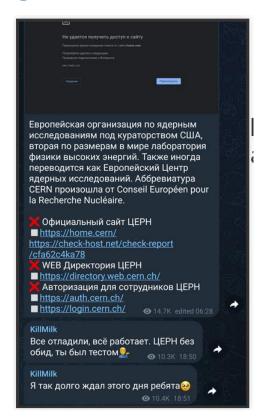

Largest scientific data repository

...And an interesting attack target

- CERN is permanently under cyber attack.
 Last attempt just happened
- Computer Security is a pillar of the whole IT infrastructure
 - Raising awareness at CERN and at partner institutes
 - It's not a matter of "if", but "when"!
 - Phishing campaigns, role games, presentations about real cases and mitigation measures, ...
 - Mandatory "Dual-Factor Authentication" (2FA) for IT operators
 - Continuous "white hat" penetration testing, in collaboration with the wider scientific community

Take-away #1

- LHC data rates range from the PB/sec at the detector to the GB/sec after filtering
- Scientific data towards Exabyte scale
- Data centres run on commodity hardware and open-source OSes
- Commercial providers are (much) larger
 - CERN remains the world-largest scientific repository
- ...Is this really "Big Data"?

Big Data

- Big data is a field that treats of ways to analyse [...] or otherwise deal with data sets that are too large or complex to be dealt with by traditional data-processing application software (Wikipedia)
 - Moving target by definition!
- From structured data, relational DBs, centralized processing...
- To unstructured data and decentralized (i.e. parallel and loosely-coupled) processing, more adapted to the Cloud
 - E.g. trend analysis, pattern recognition, image segmentation, natural language interpretation/translation, ...

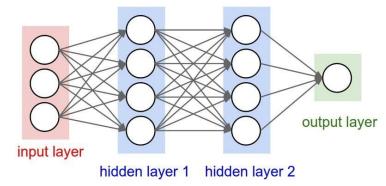

Big Data out there

- Increasing interest in Big Data analysis
 - The Power of Data: Neural Networks are well known since the 1990s, but it's only now with very large and easily accessible data sets that they become effective!
 - Lots of software frameworks for Deep Machine Learning with NNs coming up

Big Data at CERN, history

- Experiments have long used Machine Learning (once called Multi-Variate Analysis) techniques
 - Track reconstruction ~ pattern matching
 - Deep Neural Networks coming to help?
- HiggsML and TrackML Challenges
 - 2018 edition: best results obtained with pure parallel processing, without ML!

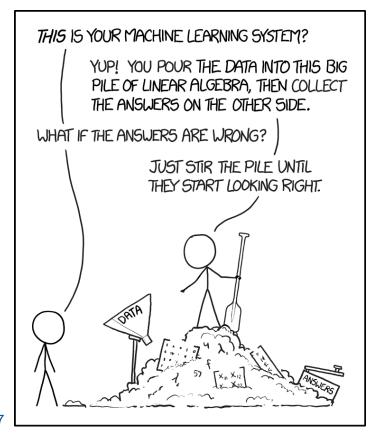

Big Data at CERN

 ...Quoted at the CERN Academic Training on Machine Learning

Big Data at CERN

- More recently, LHC Beams Control Logging
 - Extract trends and detect/predict failures
- In general, ML techniques implemented where analytical approaches are inapplicable/unpractical
 - Security forensics, system analysis/profiling, etc.
 - Typically boiling down to log analysis
- Novel trends in data acquisition systems: use ML on GPUs to "learn" how to best select/discard events

Opportunities and Risks...

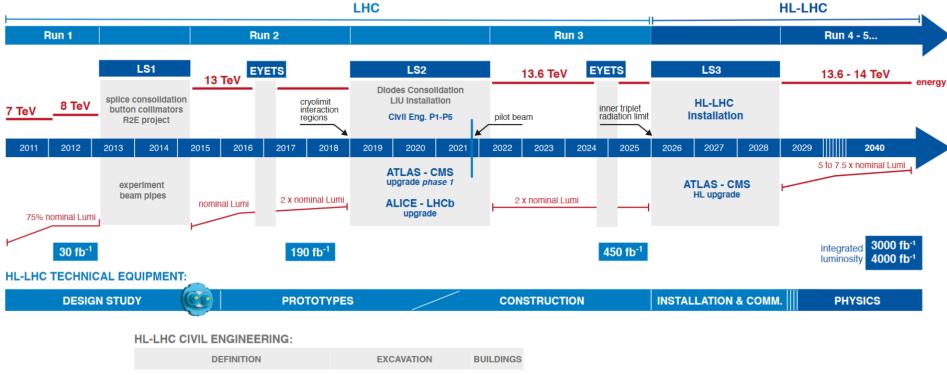

- Big Data and Data Science are popular career paths, crossing the boundaries between Computer Science, Physics and Statistics
- Fundamental science and engineering remain the pillars to understand technology!

- Big Data and Machine Learning demonstrate data's evergrowing value, in particular when dealing with personal data
 - 8 out of the top 10 world-largest companies by capitalization (including the GAFAM) are entirely based on the Data economy
 - At 10 T\$, they compare with the GDP of Germany + UK + France + Italy (11 T\$)!

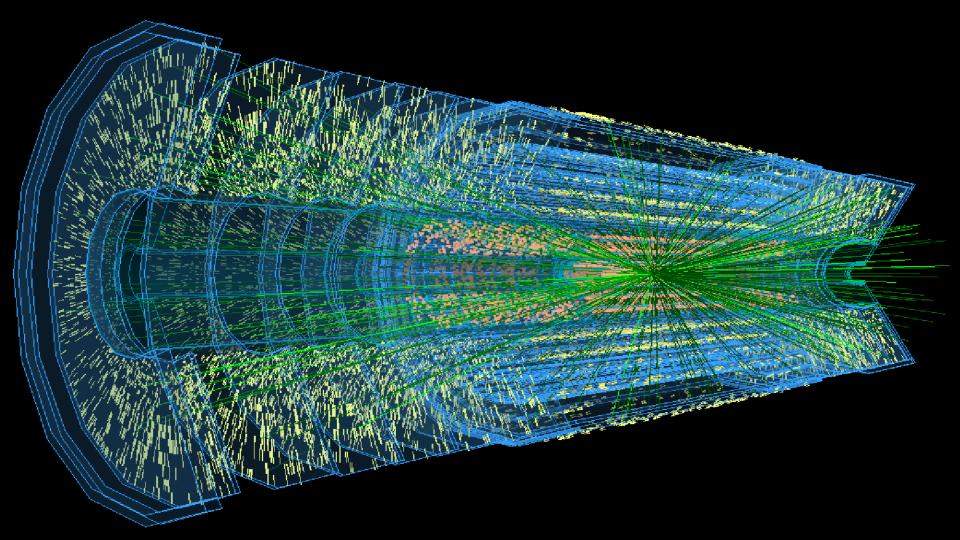

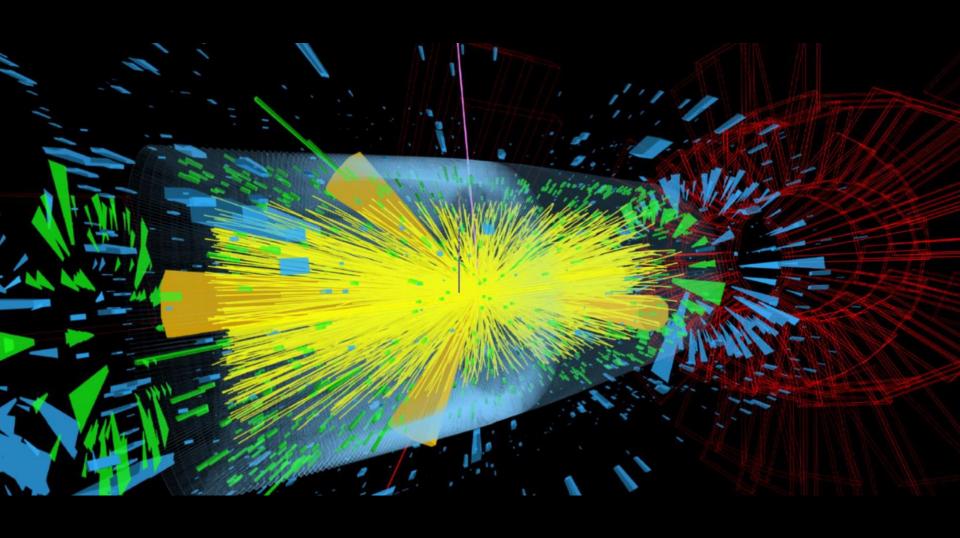

Hi-Lumi LHC: a computing challenge

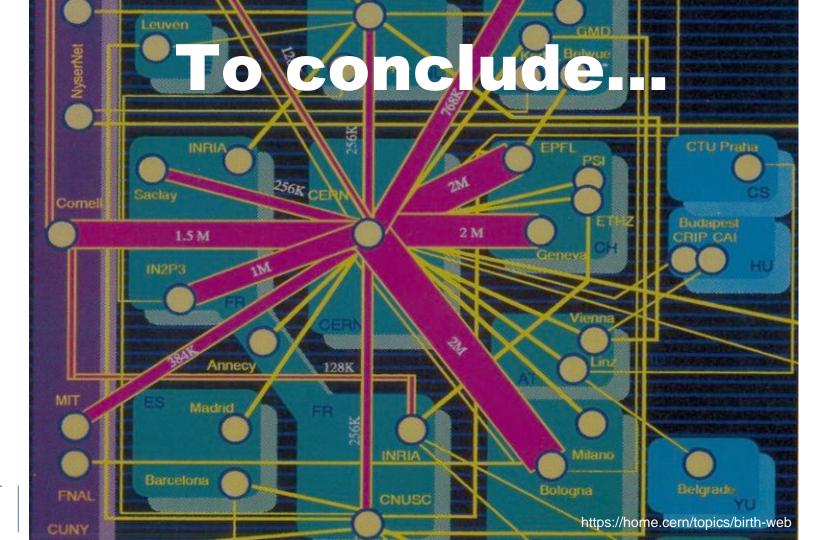

HL-LHC and friends

- High Luminosity LHC is not alone in the current arena of large scientific collaborations
- New Big Science experiments coming up:
 - Square Kilometer Array (SKA)
 - Cherenkov Telescope Array (CTA)
 - Deep Underground Neutrino Experiment (DUNE)
 - Nuclear Fusion Energy (ITER)
- Time for R&D, opportunity for new synergies
 - Increasing role of ML techniques, in particular in other sciences
 - LIGO/Virgo: GW signal detection

From CERN to the world

- Fundamental Science always pushed technology boundaries, with large returns on investments
- For computing, CERN R&D led for instance to:
 - Invention of the Web (1989)
 - Key contribution to the Internet infrastructure
 - 80% of the total European Internet traffic going through CERN in the late 1980s
 - Touch screens (1972)
 - Super Proton Synchrotron control system team required complex controls and developed capacitive touch screen
 - It was based on open standards and moved into industry

1989 - 2019

Web@

...mmm... web + touch-screen: what do you have in your pocket?

CERN-IT: pushing boundaries

- CERN-IT impact on society through computing:
 - Need for collaboration tools for Global Science led to invent the World Wide Web
 - Need for collaboration of computing resources for the Global LHC led to adopt Grid Computing, pioneering the concept of Computing Clouds
- Open access to science
 - Need for sharing the results had led CERN to pave to way to open access to documents and now data: LHC@home and CERN Opendata Portal

Openlab

- Public-private partnership to accelerate the development of cutting-edge solutions for the worldwide LHC community and wider scientific research
 - Many big IT players involved, including (in alphabetic order) Google, IBM, Intel, Microsoft, Oracle, ...
 - · Large student internship programme
- Hosts the CERN Quantum Computing Initiative
 - Mainly targeting quantum algorithms and their fit to High-Energy Physics, rather than the technology

Take-away #2

- Fundamental Science continues to be main inspiration for revolutionary ideas, due to revolutionary needs
 - Industry has well defined offer and demand. We do not.
 This is the key for innovation.
- IT industry has globally evolved beyond our scale
 - Big Data analysis techniques gaining more and more momentum
 - But there's no silver bullet!
 - The role of Open Source in software development is more and more crucial as scientific collaborations get larger
