

# Hybrid Quantum-Classical Networks for Reconstruction and Classification of EO Images

**Su Yeon Chang [CERN, EPFL]**

Bertrand Le Saux [ESA], Sofia Vallecorsa [CERN], Michelle Grossi [CERN]

26. October 2022

QUANTUM  
TECHNOLOGY  
INITIATIVE

# Introduction

## Quantum Machine Learning (QML)

- Intersection between Machine Learning (ML) and Quantum Computing (QC)
- Potential to **improve the existing ML techniques**
- Can be efficiently simulated on the real quantum hardware
- **Application of QML on images** still challenging
  - Large input dimensionality, quantum embedding methods
- Further understanding required to understand relation between quantum circuit architecture & training performance
  - Limited to standard dataset (MNIST, Fashion MNIST, etc) [1]

# Introduction

## Earth observation images

- Highly benefit from ML
- Complex, unlabelled dataset with large number of features
- Increasing number of studies on QML applied on EO
- Evaluate **the correlation between training performance and quantum circuit architecture** for a realistic EO use-case

Application of QML in EO [2]

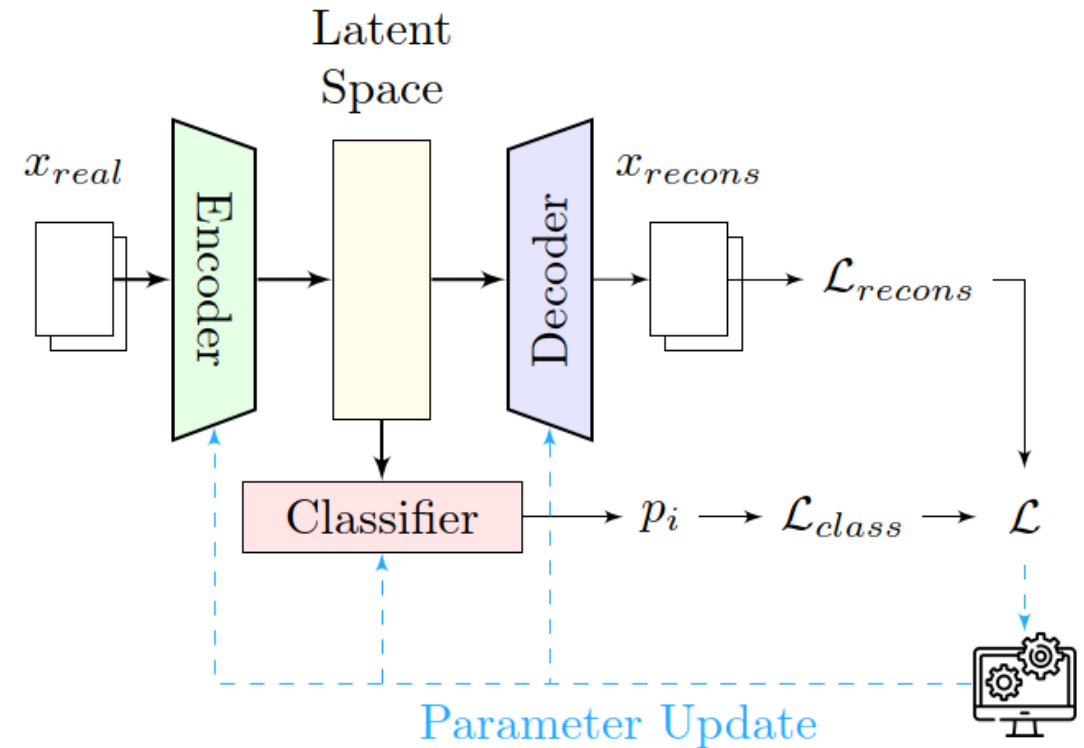

EuroSAT image samples [3]

SAT4 image samples [4]

# Hybrid Quantum-Classical model

- Multiclass-classification of large images
  - Perform **reconstruction & classification** at the same time
- Combine feature extractions & classification
- Latent space constrained in  $[0, \pi]$
  - Autoencoder = Classical
- Classifier = Classical / Quantum

Training schema of the hybrid model

# Quantum Embedding

- Mapping of classical data  $x$  into quantum state  $|\phi(x)\rangle$  in Hilbert space
- Crucial for the performance of quantum algorithm

## 1) Amplitude Encoding

$$|\phi(x)\rangle = \frac{1}{\|x\|} \sum_{i=0}^{N-1} x_i |i\rangle$$

Exponential compression in  $n_{qubits}$ , but polynomial  $n_{gates}$

## 2) Dense Qubit Encoding

$$|\phi(x)\rangle = \bigotimes_{j=1}^{\frac{N}{2}} \left( e^{-i\frac{x_{N/2+j}}{2}\sigma_x} e^{-i\frac{x_j}{2}\sigma_y} \right)$$

Constant  $n_{gates}$ , but no exponential compression

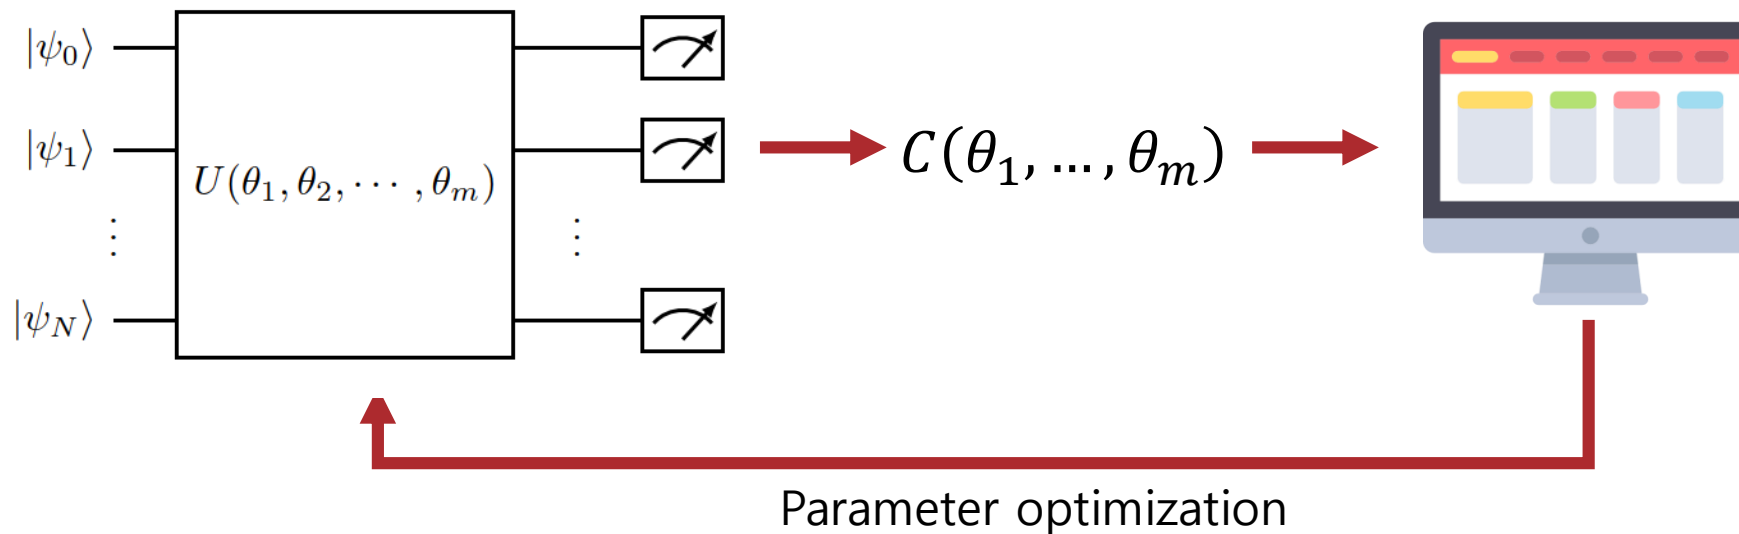

## 3) Hybrid Angle Encoding (HAE) [4]

$$|\phi(x)\rangle = \bigotimes_{k=1}^b \left( \sum_{i=1}^{2^m} \prod_{j=0}^{m-1} \cos^{1-i_j}(x_{g(j),k}) \sin^{i_j}(x_{g(j),k}) |i\rangle_k \right)$$

Compromise between amplitude encoding and qubit encoding

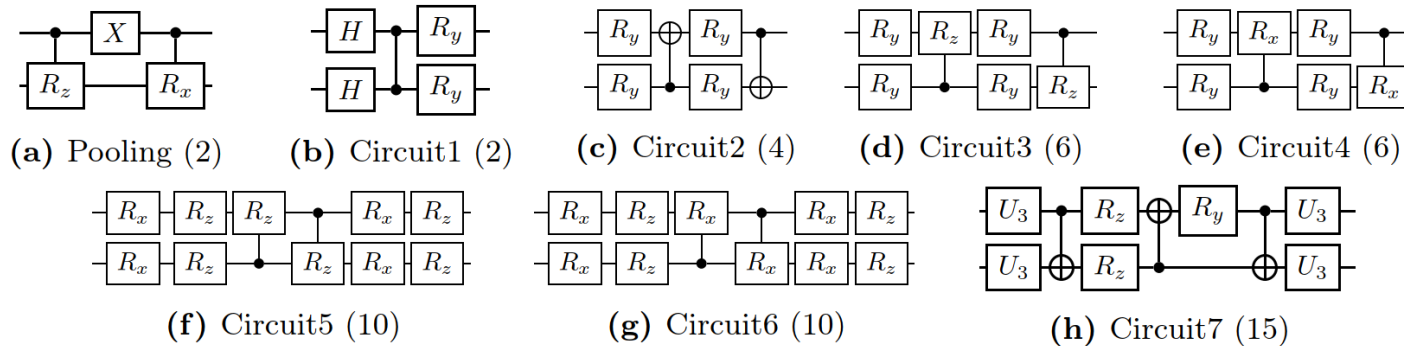

# Parameterized Quantum Circuit (PQC)

- Quantum analogue of Neural Networks
- Rotation angles = Free parameters
- Tune the parameters classically
- Framework to solve a variety of problems
- Challenges : Trainability, accuracy and efficiency

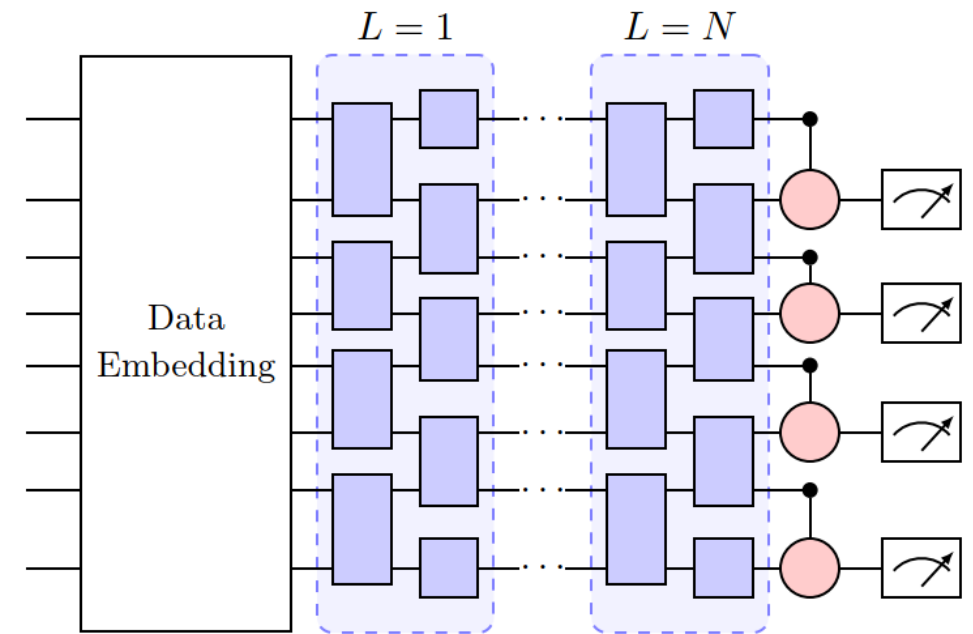

# Quantum Convolutional Neural Networks

- Quantum analogue of CNN → Preserve translational invariance
  - Avoid **barren plateau problem**
  - Start with the model proposed by T. Hur et al. [4]
  - Consists of convolutional filters & pooling layers
- Different Ansatz to be investigated

PQC ansatzes used as convolutional filters [4]

QCNN for multiclass-classification

# PQC Descriptors

- Metrics to **measure the expressive power** of a chosen PQC [1,5]
- **Expressibility** : Measure the capability of quantum circuit to express an arbitrary quantum state

$$Expr' = -\log_{10} D_{KL}(\hat{P}_{PQC}(F; \theta) || P_{Haar}(F))$$

- **Entangling Capability** : Capture the capability of a PQC to generate highly entangled states

$$Ent = \frac{1}{|S|} \sum_{\theta_i \in S} Q(|\psi_{\theta_i}\rangle)$$

$S$  = Set of sampled circuit parameters

$Q(|\psi\rangle)$  = Meyer-Wallach entanglement measure

→ Investigate relation between PQC descriptors and training performance

# Results

- Train the hybrid model with Circuit7 & L = 2 for **SAT4** (4 classes)

## Training set

## Test set

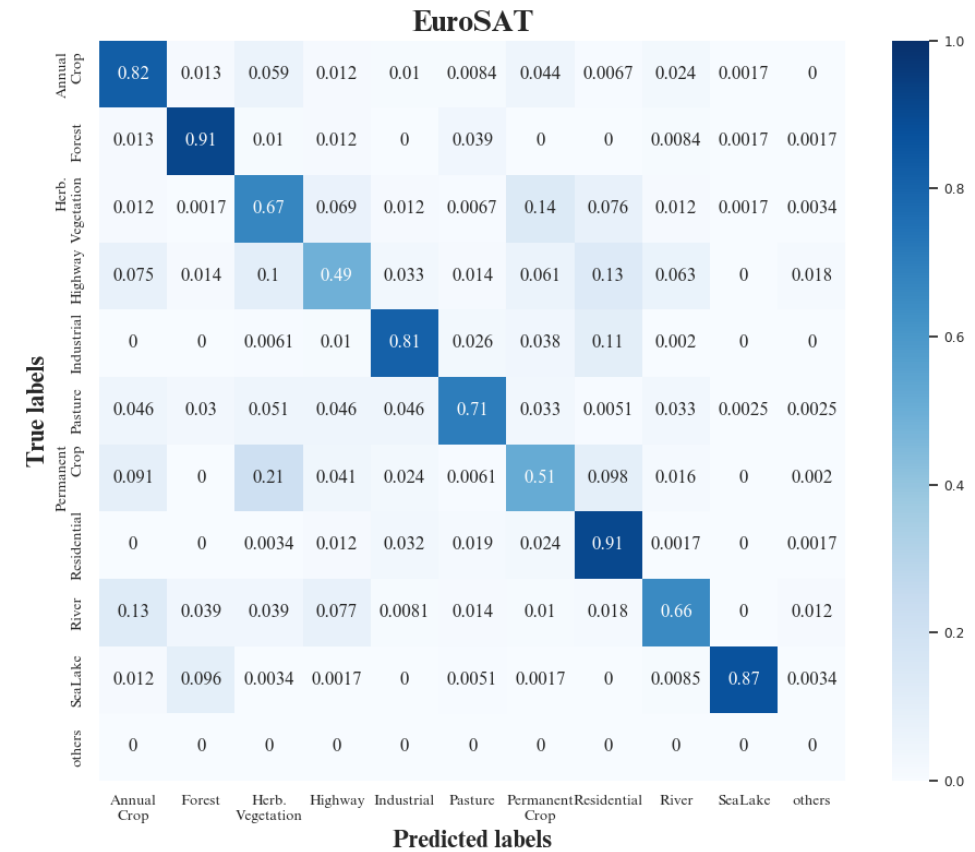

# Results

- Train the hybrid model with Circuit7 & L = 1 for **EuroSAT** (10 classes)

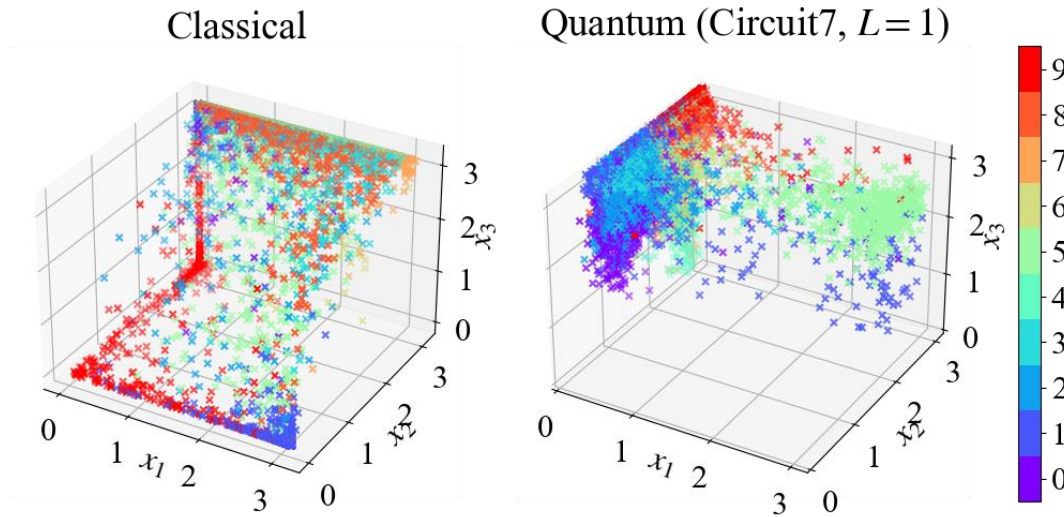

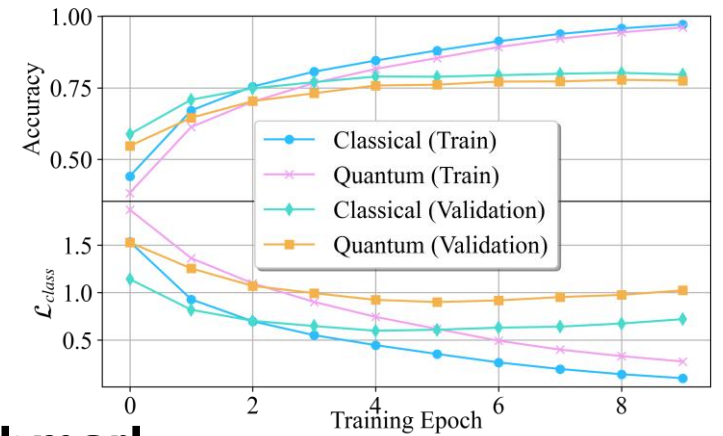

## Training set

## Test set

# Results – Distribution of latent features

Distribution in the first 3 components of the latent features

Sparsity measure  $S_{\delta}(c)$  with  $\delta = 0.05$

## Classical benchmark

- Classifier with 1D convolutional layer
- Natural emergence of sparse feature distribution

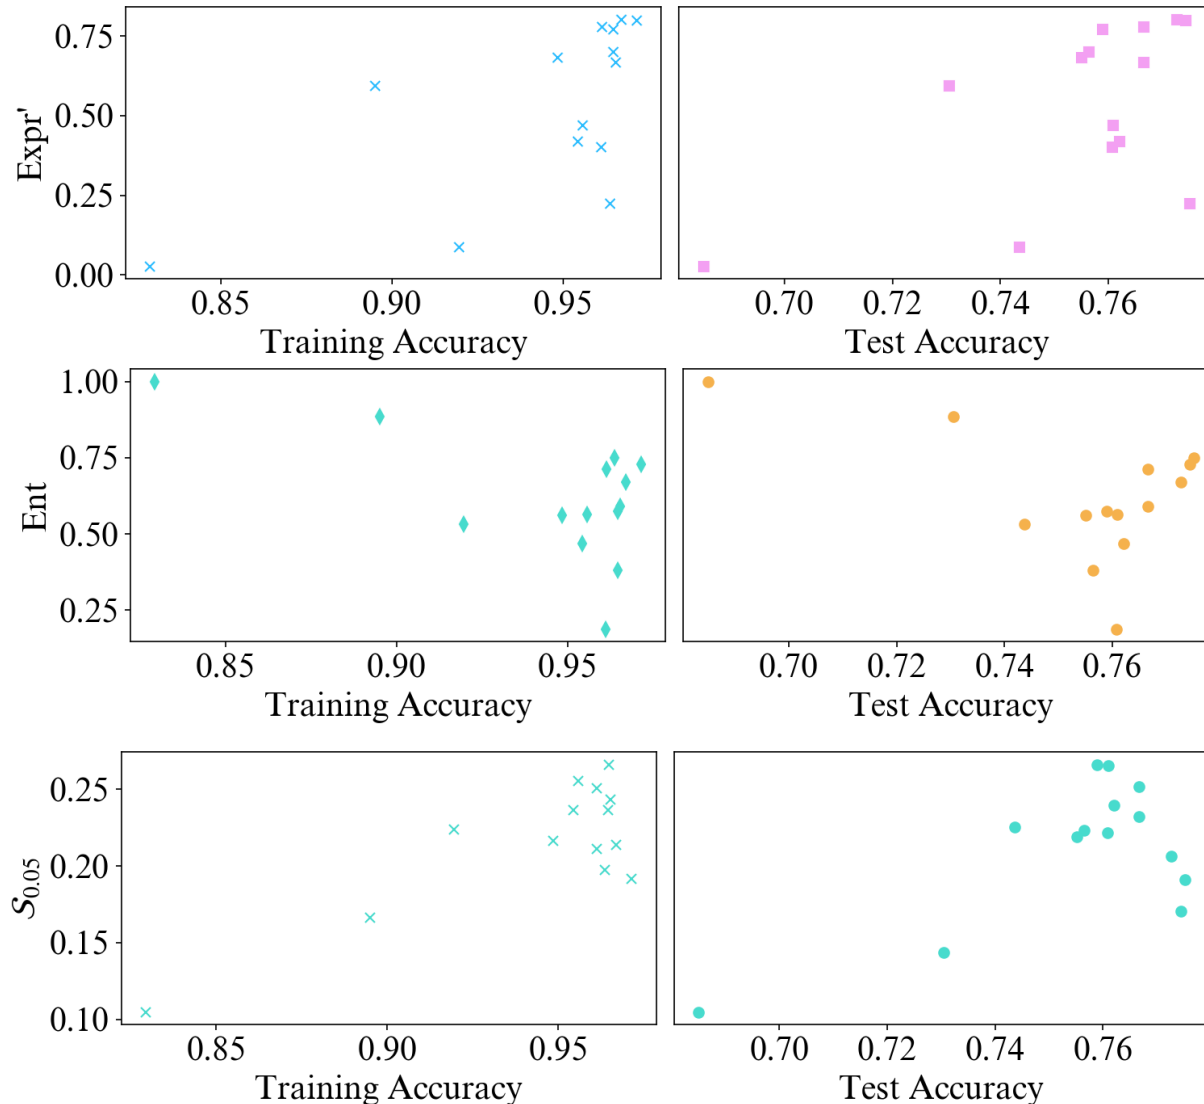

→ Measure sparseness of latent features

$$S_{\delta}(c) = |\{j \mid x_j(c) < \delta \text{ or } x_j(c) > \pi - \delta\}|$$

with  $\bar{x}_j = \frac{1}{N} \sum_{i=1}^N x_{i,j}$

- $S_{\delta, \text{classical}} < S_{\delta, \text{quantum}}$

# Results – Relation with PQC descriptors

## Pearson Correlation Coefficient

	Training	Test
Expr' v.s. Acc	0.63	0.57
Ent v.s. Acc	-0.60	-0.48
$S_{\delta}$ v.s. Acc	0.80	0.65

- Higher Expr' → Higher Accuracy
- Higher Ent → Lower Accuracy  
→ Possibility that entanglement hinders training
- Higher  $S_{\delta}$  → Higher Accuracy

# Results – Evaluation on real quantum hardware

- Evaluate pretrained model on IBMQ Montreal with 600 training samples

## DQE + Circuit 3 (91% w/o noise)

## HAE + Circuit 3 (96% w/o noise)

# Conclusion

- Construct hybrid quantum-classical model for EO image classification
  - Successful multi-class classification (99% for training, >75% for test)
- High correlation between PQC descriptors and the accuracy
  - Evidence of drawbacks for highly entangled states
- Paves the way to generic approaches for choosing the right ansatz for a given problem

## Future plans

- **Solve overfitting problem & Improve reconstruction power**
- **Study other characteristics of PQC (convergence rate, optimization landscapes)**
- **Investigate a way to encode the data with complex correlation**
