

On Authentication, Authorization and Single Sign On

*A.Lytovchenko, A.Tsaregorodtsev,
CPPM-IN2P3-CNRS, Marseille,
DIRAC Users' Workshop
9 May 2022*

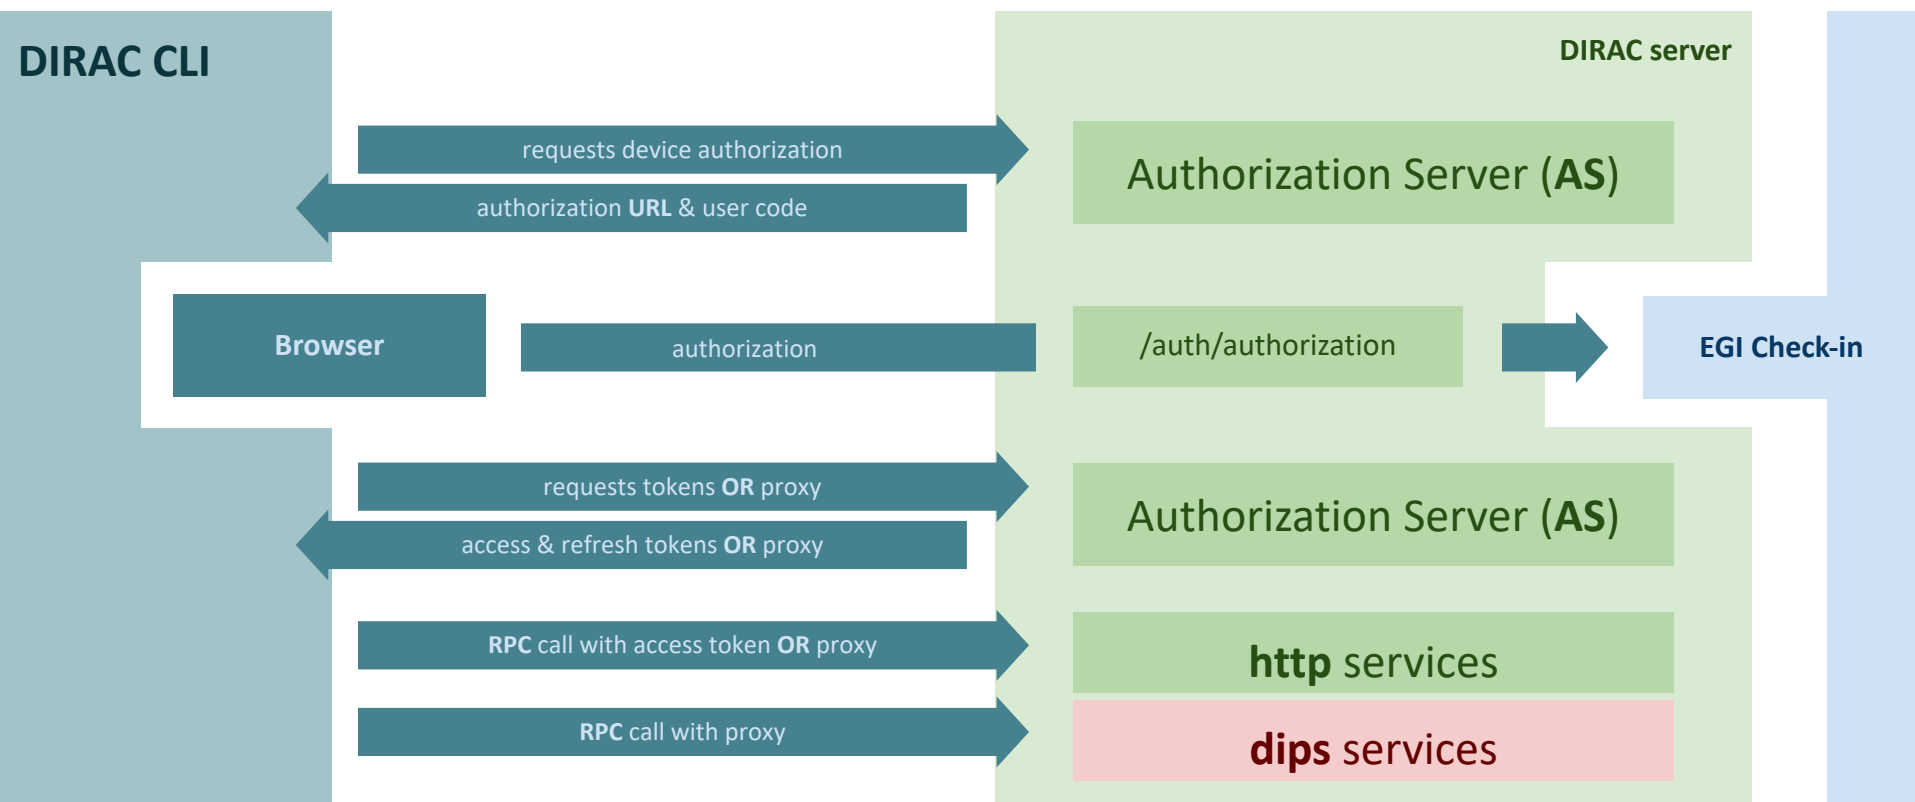

- ▶ Introduction
- ▶ Token based client/server framework
- ▶ User Management
- ▶ Token Management
- ▶ Accessing third party resources
- ▶ Summary

- ▶ So far, DIRAC uses X509 certificates for users' authentication/authorization
 - ▶ Mature technology, works well for users in HEP and some other domains
 - ▶ Complex certificate issuing procedures, many communities do not have access to recognized CA's
- ▶ The new generation AAI frameworks are based on the OAuth2/OIDC industry standards
 - ▶ Many Identity Providers (IdP) offer service for user Authentication and Management

- ▶ The DIRAC Project is developing its AAI subsystem
 - ▶ Compatible with both X509 certificates and OAuth tokens
 - ▶ Compatible with multiple IdP
- ▶ Main components
 - ▶ The DIRAC client/service protocol with AAI based on tokens
 - ▶ Token Management to provide valid tokens for asynchronous operations
 - ▶ User Management based on the information from IdPs
 - ▶ Connectors to external resources/services using tokens based AAI

- ▶ The client/service framework is updated to support both tokens and X509 proxies
 - ▶ Only HTTPS based DIRAC client service protocol is supporting tokens
 - ▶ The custom DISET protocol will stay with X509 proxies only
 - ▶ The updated framework is included in the 8.0 prereleases certification
- ▶ The user should first obtain a token before connecting to the DIRAC service
 - ▶ Using the OAuth standard protocols

The login with **DIRAC CLI** is as follows:

1 Initialize authorization flow

```
$ dirac-login --token  
Authorization pending.. (use CNTL + C to stop)
```

3 Save the received token

```
New token is saved to /tmp/bt_u504.  
subject      : 22bca818-acea-46bd-b290-c7536c56f962  
issuer       : https://wlcg.cloud.cnaf.infn.it/  
timeleft     : 01:59:56  
username     : alytov  
DIRAC group  : wlcg_user  
properties   : NormalUser
```

2 Authenticate via EGI Check-in in a browser

Identity Provider selection..
i Dirac itself is not an Identity Provider.
You will need to select one to continue.

✓ authorization complete!
i Authorization has been completed, now
you can close this window and return to
the terminal.

- ▶ WebApp portal users will be given a choice of authorization method by selecting a certificate or identity provider

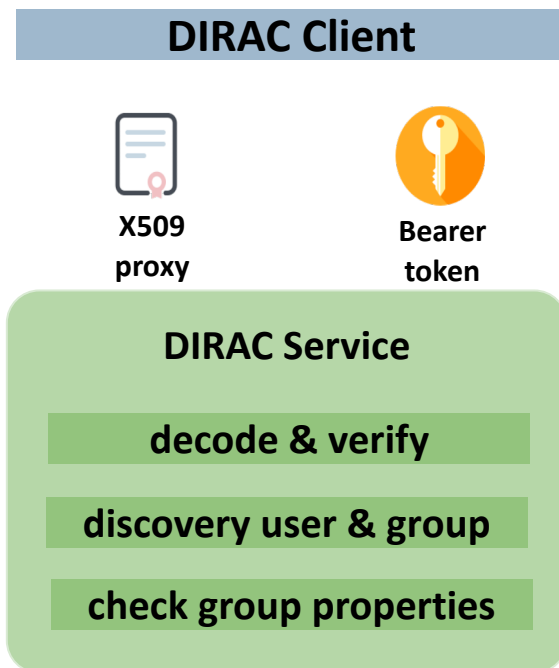

User:

Group:

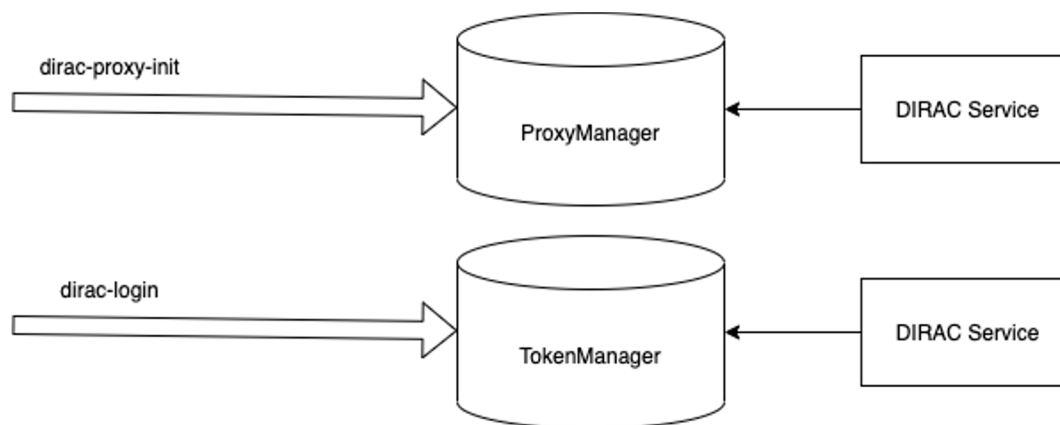

Setup:

Theme:

- ▶ The proxy or token received from the client is first checked and validated. In the case of a token, the signature with the public key of the corresponding **IdP** is checked.
- ▶ Using the DIRAC **Registry** and the information obtained from the proxy or token, the corresponding group is determined
- ▶ Finally, the **AuthManager** checks access rights of the received user group to the requested resource.

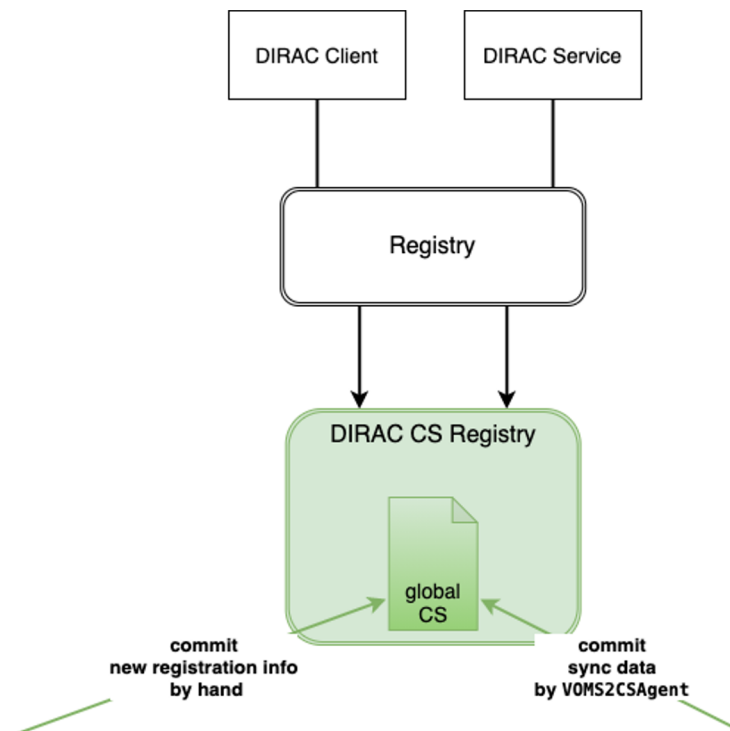

- ▶ Users delegate their rights to DIRAC by uploading their long proxy certificates. Similar mechanism for OAuth2 access tokens is necessary

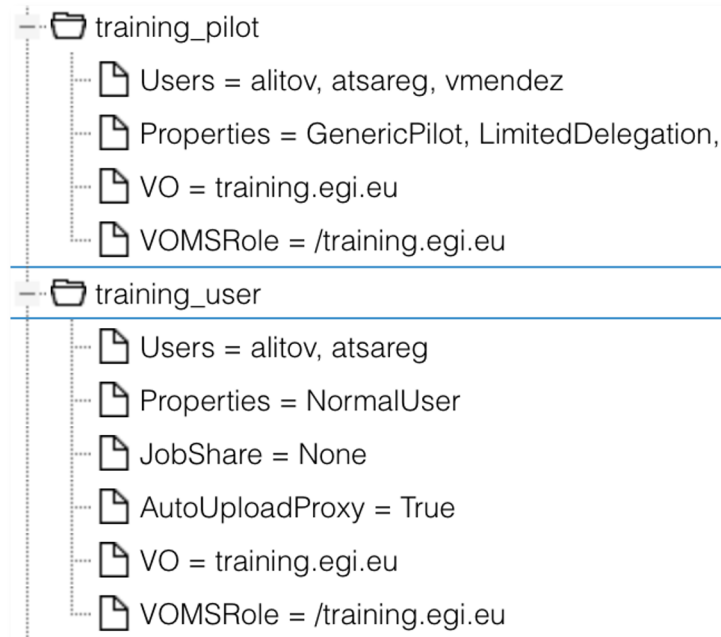

- ▶ Proxies are stored and served by the ProxyManager service
- ▶ Tokens are also deposited in the database in the TokenManager service:
 - ▶ after successful authorization through the **IdP**
 - ▶ Both access and refresh token
 - ▶ DIRAC service being a registered client of the **IdP**, is able to maintain access tokens valid
- ▶ TokenManager service is developed and will be included in 8.0 release

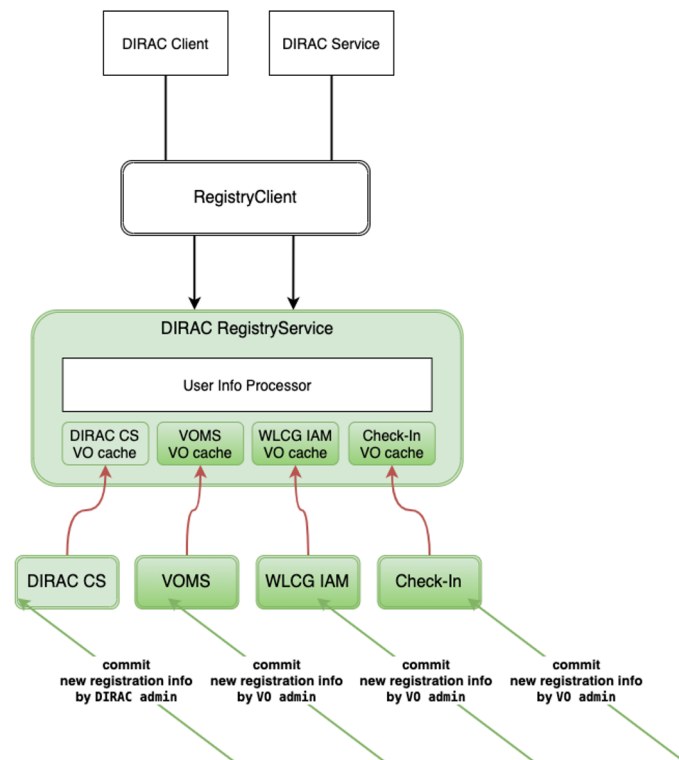

- ▶ Currently, all users are described in the DIRAC configuration in the Registry section
- ▶ The user's information is synchronized with the VOMS servers using VOMS2CS agent
- ▶ User's IdP information can be added by hand by administrator

- ▶ User rights with respect to DIRAC services are determined by DIRAC groups
- ▶ Currently, DIRAC groups correspond to VOMS roles
 - ▶ One-to-many relation
 - ▶ DIRAC defines which users belong to which groups
- ▶ With IdPs DIRAC groups will correspond to unique scopes
 - ▶ One-to-one relation
- ▶ IdP scopes will completely define user rights in DIRAC
 - ▶ User management is moved completely to IdPs

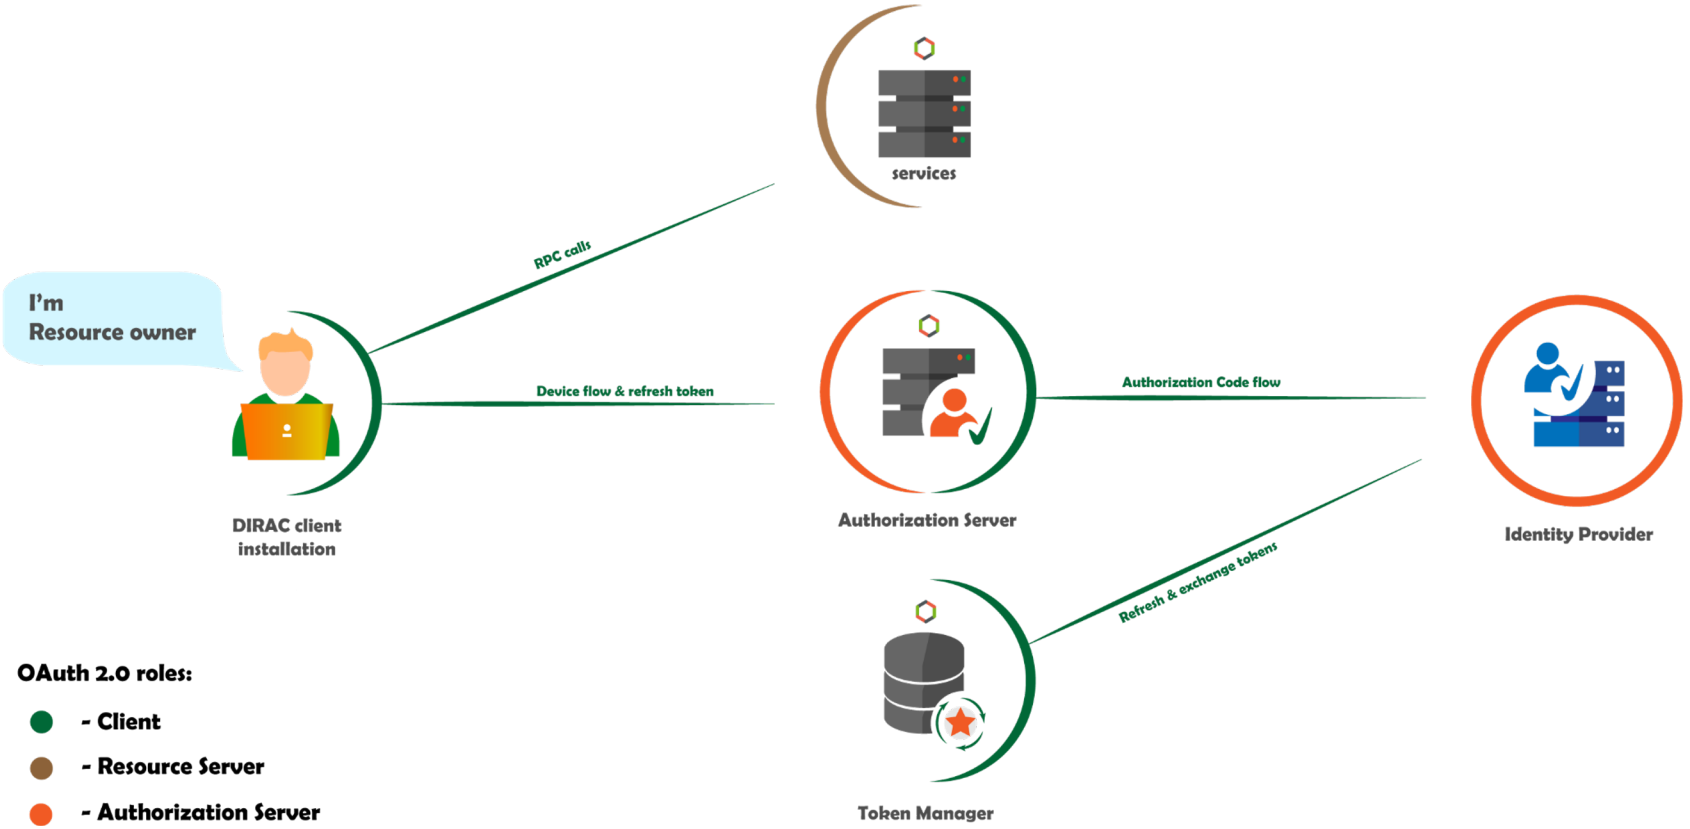

- ▶ **Registry service** receives information about VO users from **IdP's** or VOMS services. There is no need to store this information in the DIRAC configuration
- ▶ User management is completely outside DIRAC, this is done by VO administrators using IdP web interfaces
- ▶ DIRAC trusts and relies entirely on the information received from the relevant **IdP**.
- ▶ This is the work in progress

- ▶ Using tokens to access computing resources
 - ▶ Access to Computing Elements (HTCondorCE,ARC) is in development
 - ▶ Need for token enabled services for testing
 - ▶ Use AREX ARC CE connector (*see Alexandre's talk*)
 - ▶ The Pilot framework will continue to use proxies at the first stage
 - ▶ Using tokens for pilot/server communications is to be developed as the next step
 - ▶ Access to Cloud resources with tokens was demonstrated (EGI Fedcloud sites)
 - ▶ Openstack and libcloud based connectors
 - ▶ Integration with the TokenManager, Cloud/SiteDirectors is to be developed
- ▶ Developing access to Storage Elements with tokens will start soon

- ▶ The base DIRAC framework with tokens is ready for 8.0 release and will allow user's interaction with DIRAC service – both CLI and Web Portal access
- ▶ Basic User Management is developed. Dynamic Registry delegating User Management to IdP's is under development
- ▶ TokenManager service being certified – will allow asynchronous access to Computing and Storage Elements
- ▶ Token based connections are available for cloud resources. Connection to other resources (HTCondorCE, ARC, Storage) are under development
