# Supernova-scope

## for the Direct Search of Supernova Axions

**Koichi Hamaguchi (Tokyo U.)**

@ 2022\_Chung-Ang University BSM Workshop (online), February 7, 2021.

Based on [arXiv:2008.03924] JCAP **11** (2020) 059  
Shao-Feng Ge (TDLI), Koichi Hamaguchi (Tokyo), Koichi Ichimura (Tohoku),  
Koji Ishidoshiro (Tohoku), Yoshiki Kanazawa (Tokyo), Yasuhiro Kishimoto (Tohoku),  
Natsumi Nagata (Tokyo), Jiaming Zheng (TDLI).

# Supernova 1987A (February 23, 1987)

before explosion

<https://images.datacentral.org.au/malin/AAT/050a>

<http://www-sk.icrr.u-tokyo.ac.jp/sk/physics/supernova-e.html>

What if the **next nearby SN** occurs?

We could learn a lot about neutrino, supernova, and maybe...

# Toady's Main message

- If a nearby ( $<$  a few 100 pc) **supernova (SN)** occurs, a huge number of **axions** (in addition to neutrinos) may arrive at the Earth.
- Those **SN axions** may be detected by an **axion Supernova-scope** with the help of **pre-SN neutrino alert**.

Similar idea in: G.G.Raffelt, J.Redondo, N.Viaux Maira (2011), I.G.Irastorza, J.Redondo (2018).

- **SN-scopes** based on the next-generation axion helioscopes (such as IAXO) have potential to detect  **$O(1-100)$  SN axions**.

[arXiv:2008.03924] JCAP **11** (2020) 059.

SN

# Motivation: mini-review of axion

- **Strong CP problem**

$$\mathcal{L}_{\text{SM}} \ni \frac{\alpha_s}{8\pi} \theta G_{\mu\nu}^a \widetilde{G}^{a\mu\nu} - \sum_q m_q \bar{q} \theta_q i\gamma_5 q$$

Experimental constraint (neutron EDM):  $|\bar{\theta}| \lesssim 10^{-10}$

**Why?**

$$\left( \bar{\theta} = \theta + \sum_q \theta_q \right)$$

**The most serious fine-tuning problem in the SM.  
It cannot be explained even by the anthropic discussion.**

# Motivation: mini-review of axion

- Strong CP problem

$$\mathcal{L}_{\text{SM}} \ni \frac{\alpha_s}{8\pi} \theta G_{\mu\nu}^a \tilde{G}^{a\mu\nu} - \sum_q m_q \bar{q} \theta_q i\gamma_5 q$$

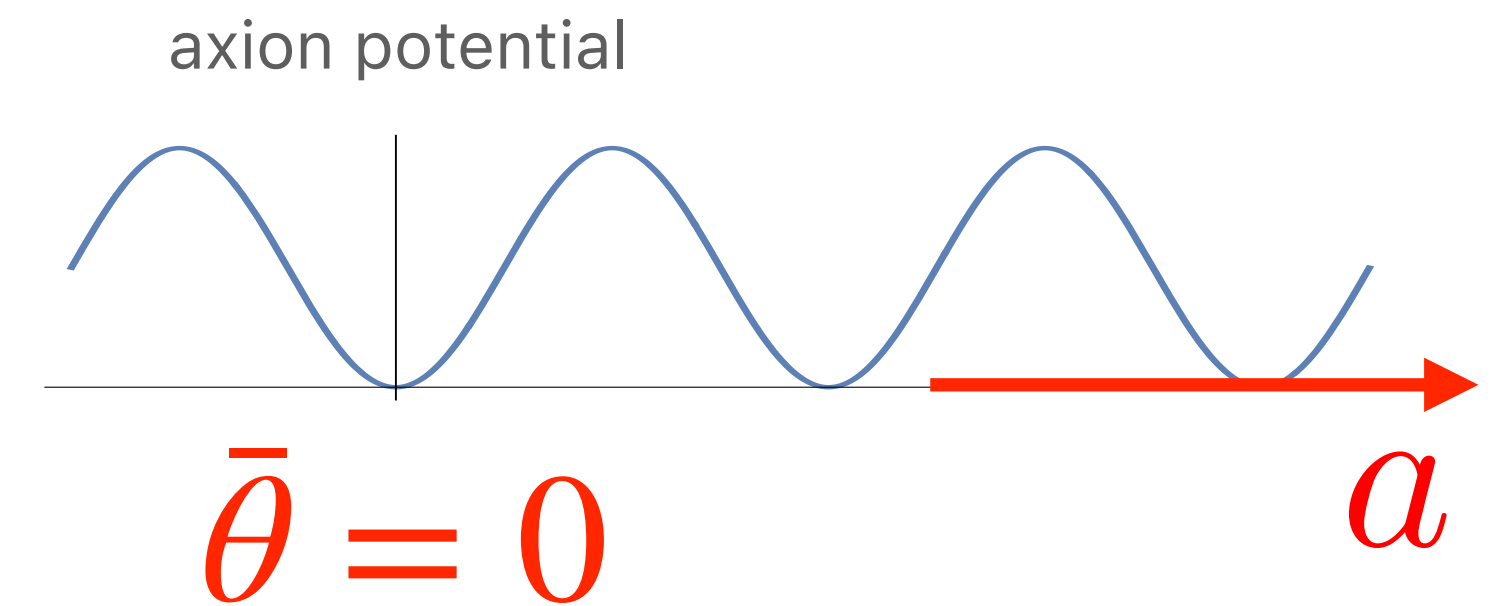

Experimental constraint (neutron EDM):  $|\bar{\theta}| \lesssim 10^{-10}$

Why?

$$\bar{\theta} = \theta + \sum_q \theta_q$$

- It can be solved by the "Peccei-Quinn mechanism", [Peccei, Quinn,'77] predicting a very light particle, Axion. [Weinberg,'78, Wilczek,'78]

$$\mathcal{L}_{\text{axion}} \ni \frac{\alpha_s}{8\pi} \frac{a}{f_a} G_{\mu\nu}^a \tilde{G}^{a\mu\nu}$$

- Moreover, Axion can be the Dark Matter.

$$\Omega_a h^2 = 0.18 \theta_i^2 \left( \frac{f_a}{10^{12} \text{ GeV}} \right)^{1.19}$$

[Turner,'86]

# Motivation: mini-review of axion

- Axion's **coupling** is determined by **the decay constant  $f_a$** .

$$\mathcal{L}_{\text{int}} = \frac{\alpha_s}{8\pi} \frac{a}{f_a} \underbrace{G^{a\mu\nu} \widetilde{G}_{\mu\nu}^a}_{\text{gluon}} + \frac{1}{4} \frac{C_{a\gamma\gamma}}{f_a} a \underbrace{F_{\mu\nu} \widetilde{F}^{\mu\nu}}_{\text{photon}} + \sum_{f = \text{quarks, leptons}} \frac{1}{2} \frac{C_f}{f_a} \bar{f} \gamma^\mu \gamma_5 f \partial_\mu a.$$

$$C_{a\gamma\gamma} = \frac{\alpha}{2\pi} \left( \frac{E}{N} - \frac{2}{3} \frac{4m_d + m_u}{m_u + m_d} \right), \quad \begin{cases} C_q = 0 \quad (\text{KSVZ}) \\ C_{u,c,t} = \cos^2 \beta/3, \quad C_{d,s,b} = \sin^2 \beta/3 \quad (\text{DFSZ}) \end{cases}$$

- Axion's **mass** is also determined by  **$f_a$** .

$$m_a = \frac{\sqrt{m_u m_d}}{m_u + m_d} \frac{f_\pi m_\pi}{f_a} \simeq 5.8 \times \left( \frac{10^9 \text{ GeV}}{f_a} \right) \text{ meV}.$$

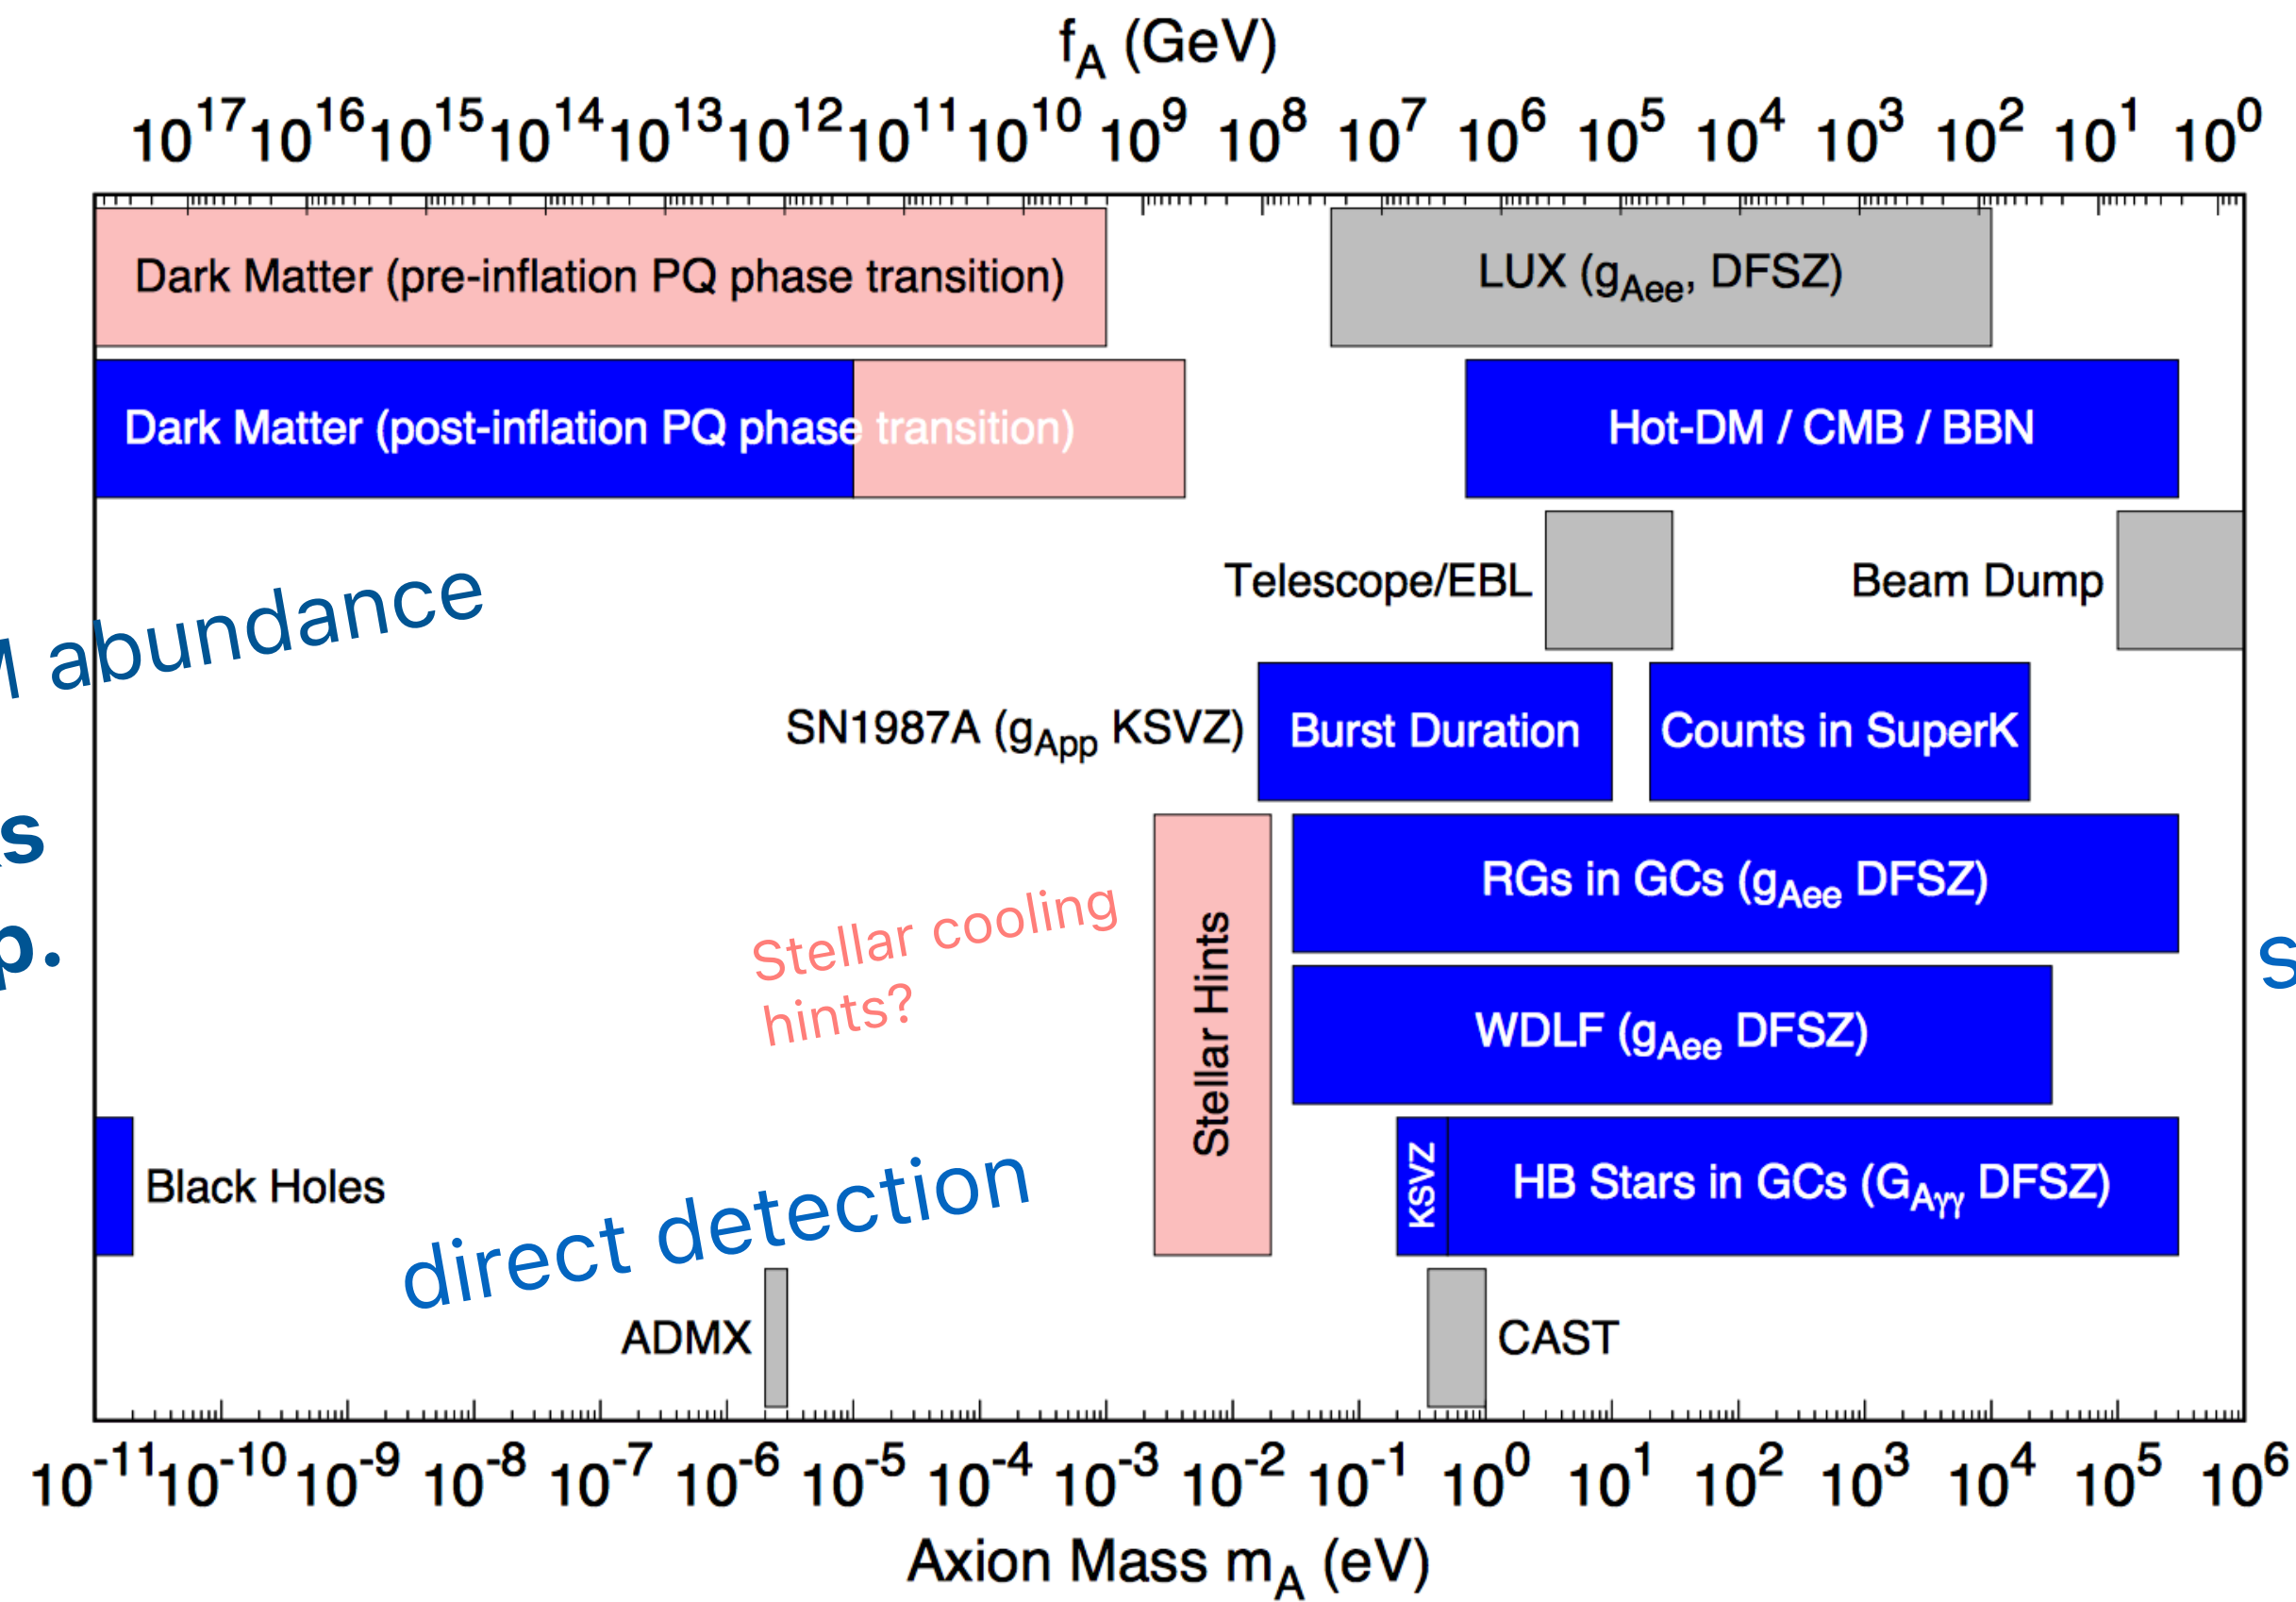

- Roughly speaking, all parameters are determined by  **$f_a$**  up to O(1) model dependent parameters.

# Motivation: mini-review of axion

## Constraints

[Particle Data Group 2018]

👉 Cosmology + DM abundance  
several related talks  
in this workshop.

direct detection

Stellar cooling  
hints?

stellar Coolings

# Motivation: mini-review of axion

## Constraints

- **SN1987A:**  $f_a \gtrsim 4 \times 10^8 \text{ GeV}$  (KSVZ) [P.Carenza et.al., 2019 + others]
- **Neutron Star Cooling**  $f_a \gtrsim 5 \times 10^8 \text{ GeV}$  (KSVZ)  
[KH, N.Nagata, K.Yanagi, J.Zheng, 2018 + others]

But there are various uncertainties.

[e.g., N.Bar, K.Blum, G.D'amico 2019]

There are also hints for stellar cooling.

preferred values:  $f_a \sim 8 \times 10^7 \text{ GeV}$ ,  $\tan \beta \sim 0.28$  (DFSZ). (SN1987A not included).

[M. M. Giannotti, I. G. Irastorza, J. Redondo, A. Ringwald, and K. Saikawa 2017]

It would be nice if there is more direct way of probing axions produced from the stellar objects.

SN

# Observation time fraction

Fig. from IAXO homepage

$$-\theta_{\max} \leq \theta \leq +\theta_{\max}$$

maximum elevation:

$$\theta_{\max} = \begin{cases} 25^\circ & (\text{IAXO}) \\ 20^\circ & (\text{TASTE}) \end{cases}$$

# Observation time fraction

Come on!  
Axion!

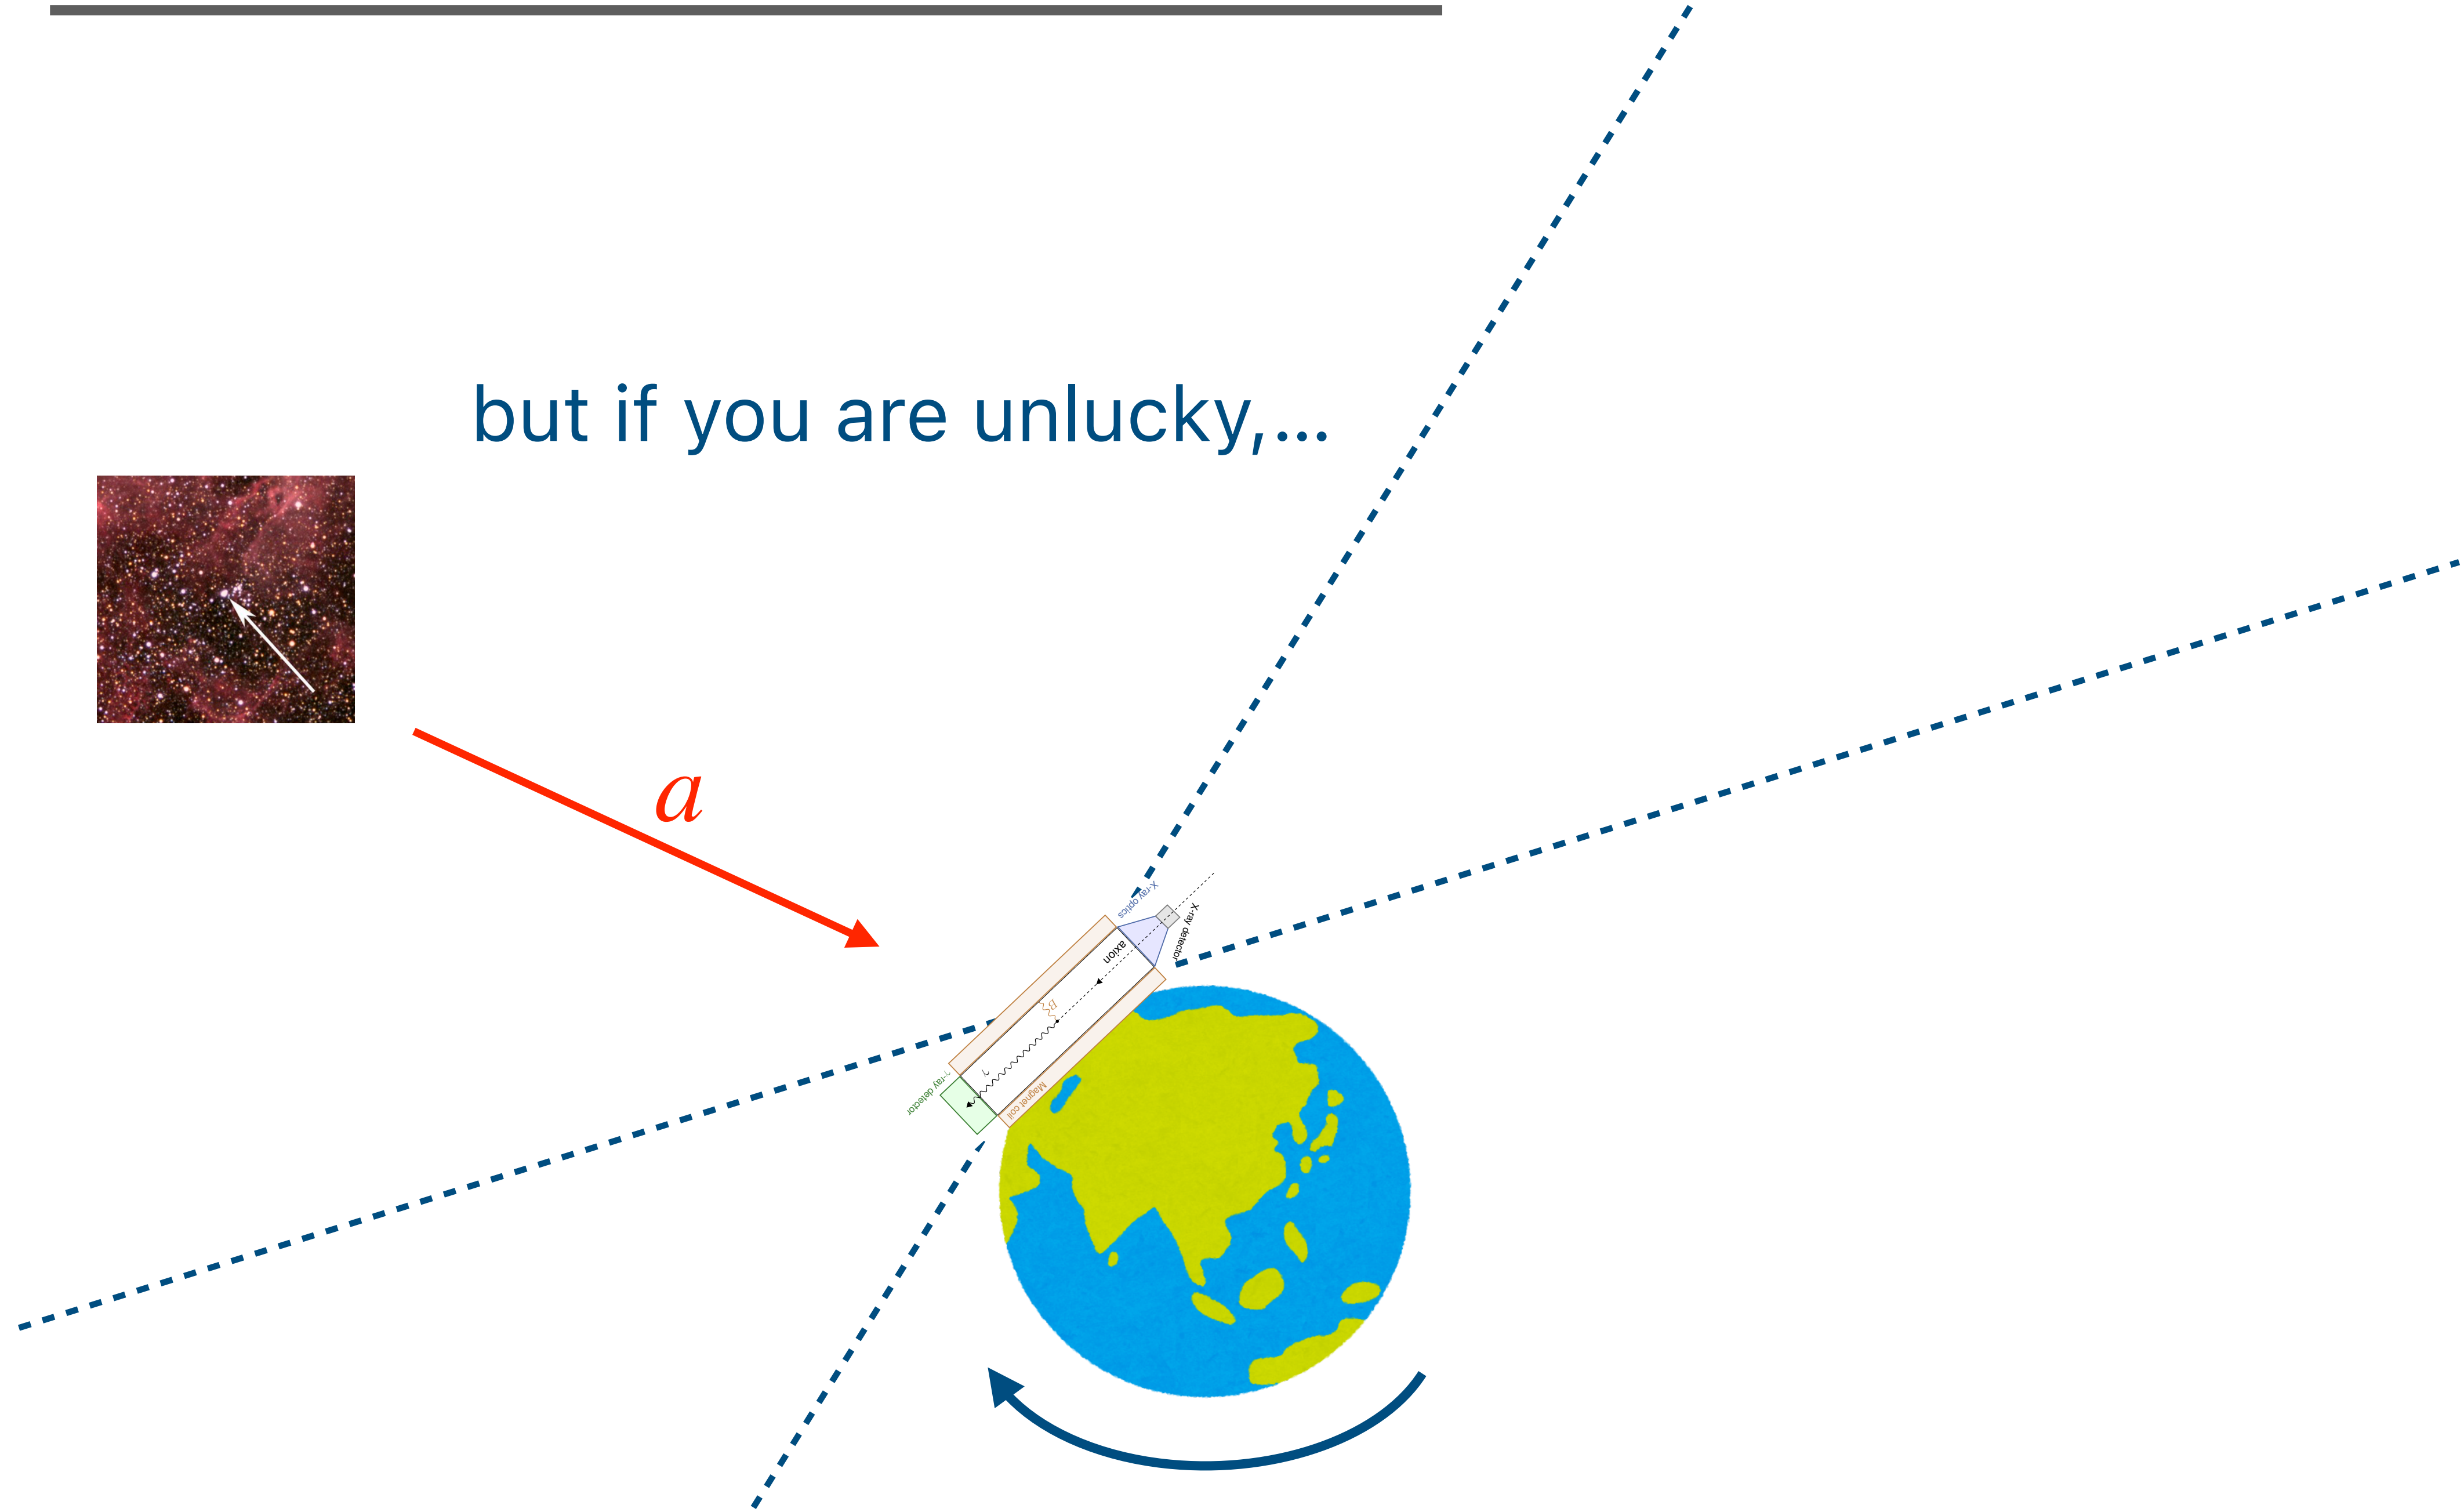

# Observation time fraction

but if you are unlucky,...

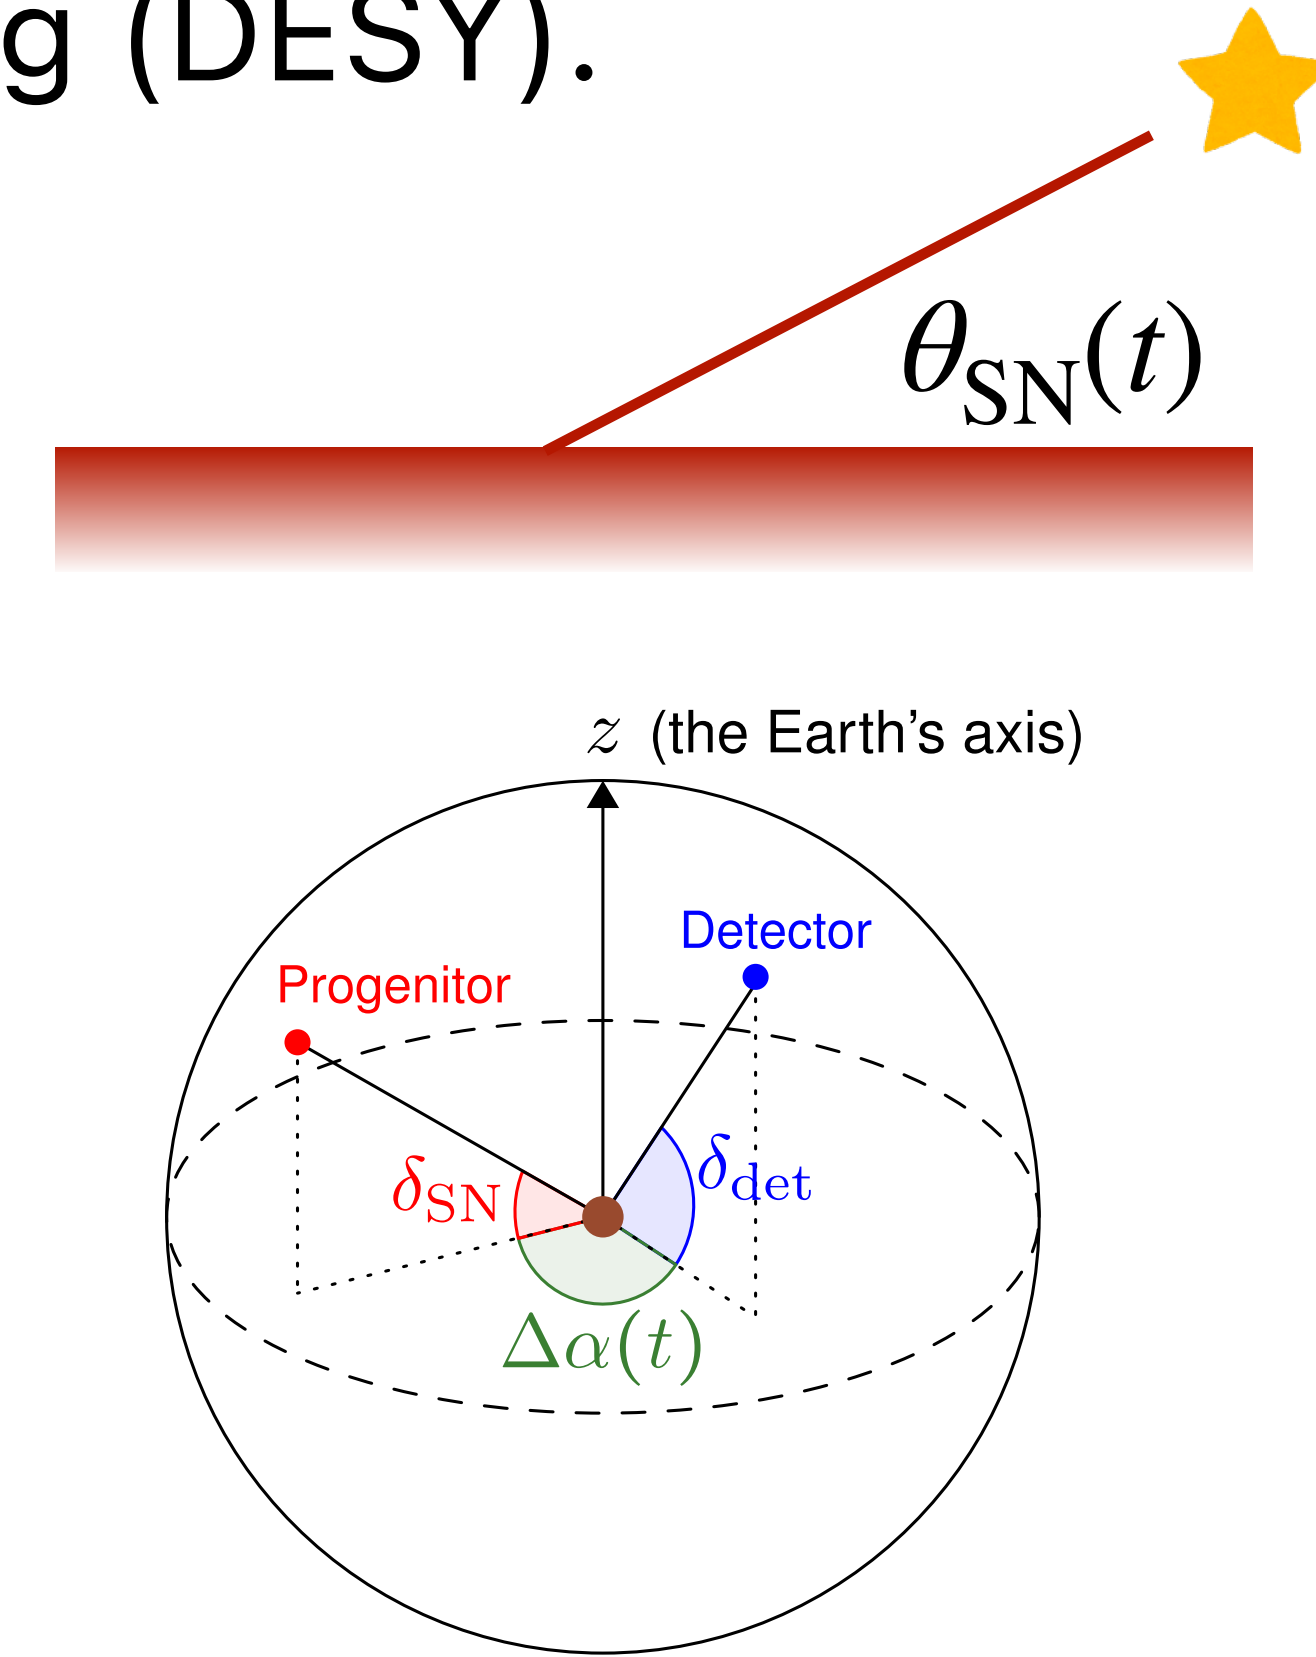

*a*

# Observation time fraction

The altitude of the progenitors  $\theta_{\text{SN}}(t)$  seen from Hamburg (DESY).

$$\sin \theta_{\text{SN}}(t) = \cos \delta_{\text{SN}} \cos \delta_{\text{det}} \cos \Delta\alpha(t) + \sin \delta_{\text{SN}} \sin \delta_{\text{det}}$$

Observational time fraction  $> 50\%$  for all the progenitors except  $\alpha$  Lupi.

# Observation time fraction

S.Ge, K.Hamaguchi, K.Ichimura, K.Ishidoshiro,  
Y.Kanazawa, Y.Kishimoto, N.Nagata, J.Zheng.  
[arXiv:2008.03924] JCAP 11 (2020) 059.

The time fraction can be increased by

- increasing the maximum elevation  $\theta_{\max}$  and/or
- two SN-scopes at different observation points (e.g., Hamburg and Tokyo)

100% covered if

- $\theta_{\max} = 50^\circ$
- Hamburg + Tokyo.

# Plan

  - Observation time fraction
  - **Event number**
- **Summary**

SN

# Event number

$\ll$

$$N_{\text{event}} = N_a^{\text{SN}} \times \frac{A}{4\pi d^2} \times P_{a \rightarrow \gamma}$$

# Event number

$$N_{\text{event}} = N_a^{\text{SN}} \times \frac{A}{4\pi d^2} \times P_{a \rightarrow \gamma}$$

$$NN' \rightarrow NN' + a$$

$(N, N' = n, p)$

## Production

- For the axion luminosity, we followed [P.Carenza et.al., 1906.11844], which includes various corrections to the one-pion exchange approximation. At the post-bounce time 1sec,

$$L_a \simeq 2.42 \times 10^{70} \text{ erg} \cdot \text{s}^{-1} \times \left( \frac{m_N}{f_a} \right)^2 C_{N,\text{eff}}^2$$

where  $C_{N,\text{eff}}^2 \equiv C_n^2 + 0.61C_p^2 + 0.53C_nC_p$ .

- We also include the temperature dependence,  $\sim T^{5/2}$ .
- The axion energy is  $\langle E_a \rangle \simeq 2.3T$ .

- Thus, the total number of axions from SN is

$$N_a^{\text{SN}} = \dot{N}_a \Delta t = \frac{L_a}{\langle E_a \rangle} \Delta t \simeq 3 \times 10^{57} \left( \frac{3 \times 10^8 \text{ GeV}}{f_a} \right)^2 \left( \frac{C_{N,\text{eff}}}{0.37} \right)^2 \left( \frac{\Delta t}{10 \text{ s}} \right) \left( \frac{T}{30 \text{ MeV}} \right)^{5/2}$$

KSVZ

$$\begin{cases} C_p = -0.47 \\ C_n = -0.02 \end{cases} \quad (\text{KSVZ})$$

$$\begin{cases} C_p = -0.182 - 0.435 \sin^2 \beta \\ C_n = -0.160 + 0.414 \sin^2 \beta \end{cases} \quad (\text{DFSZ})$$

# Event number

$$N_{\text{event}} = N_a^{\text{SN}} \times \frac{A}{4\pi d^2} \times P_{a \rightarrow \gamma}$$

$$\frac{A}{4\pi d^2} = 8.5 \times 10^{-39} \left( \frac{A}{2.3 \text{ m}^2} \right) \left( \frac{150 \text{ pc}}{d} \right)^2$$

Experiment	(Proposed) site	$B$ (T)	$L$ (m)	$A$ (m <sup>2</sup> )

IAXO+ [41]	DESY	$\sim 3.5$	22	3.9
TASTE [42]	INR	3.5	12	0.28

suppression factor

$$\text{for } m_a \gtrsim \sqrt{\frac{2\langle E_a \rangle}{L}}$$

( $a \leftrightarrow \gamma$  oscillation)

# Event number

$$N_{\text{event}} = N_a^{\text{SN}} \times \frac{A}{4\pi d^2} \times P_{a \rightarrow \gamma}$$

After all,...

$$N_{\text{event}} \simeq 1.0 \times \underbrace{\left( \frac{3 \times 10^8 \text{ GeV}}{f_a} \right)^4 \left( \frac{C_{N,\text{eff}}}{0.37} \right)^2 \left( \frac{C_{a\gamma\gamma}}{\alpha/\pi} \right)^2}_{\text{axion model}} \times \underbrace{\left( \frac{150 \text{ pc}}{d} \right)^2 \left( \frac{\Delta t}{10 \text{ s}} \right) \left( \frac{T}{30 \text{ MeV}} \right)^{5/2}}_{\text{SN}}$$

$$\times \underbrace{\left( \frac{A}{2.3 \text{ m}^2} \right) \left( \frac{B}{2.5 \text{ T}} \right)^2 \left( \frac{L}{20 \text{ m}} \right)^2}_{\text{detector}} \times \left( \frac{\sin(qL/2)}{qL/2} \right)^2.$$

※ We expect roughly O(1)~10 uncertainty, especially from SN part.

# Event number

S.Ge, K.Hamaguchi, K.Ichimura, K.Ishidoshiro,  
 Y.Kanazawa, Y.Kishimoto, N.Nagata, J.Zheng.  
[\[arXiv:2008.03924\]](https://arxiv.org/abs/2008.03924) JCAP **11** (2020) 059.

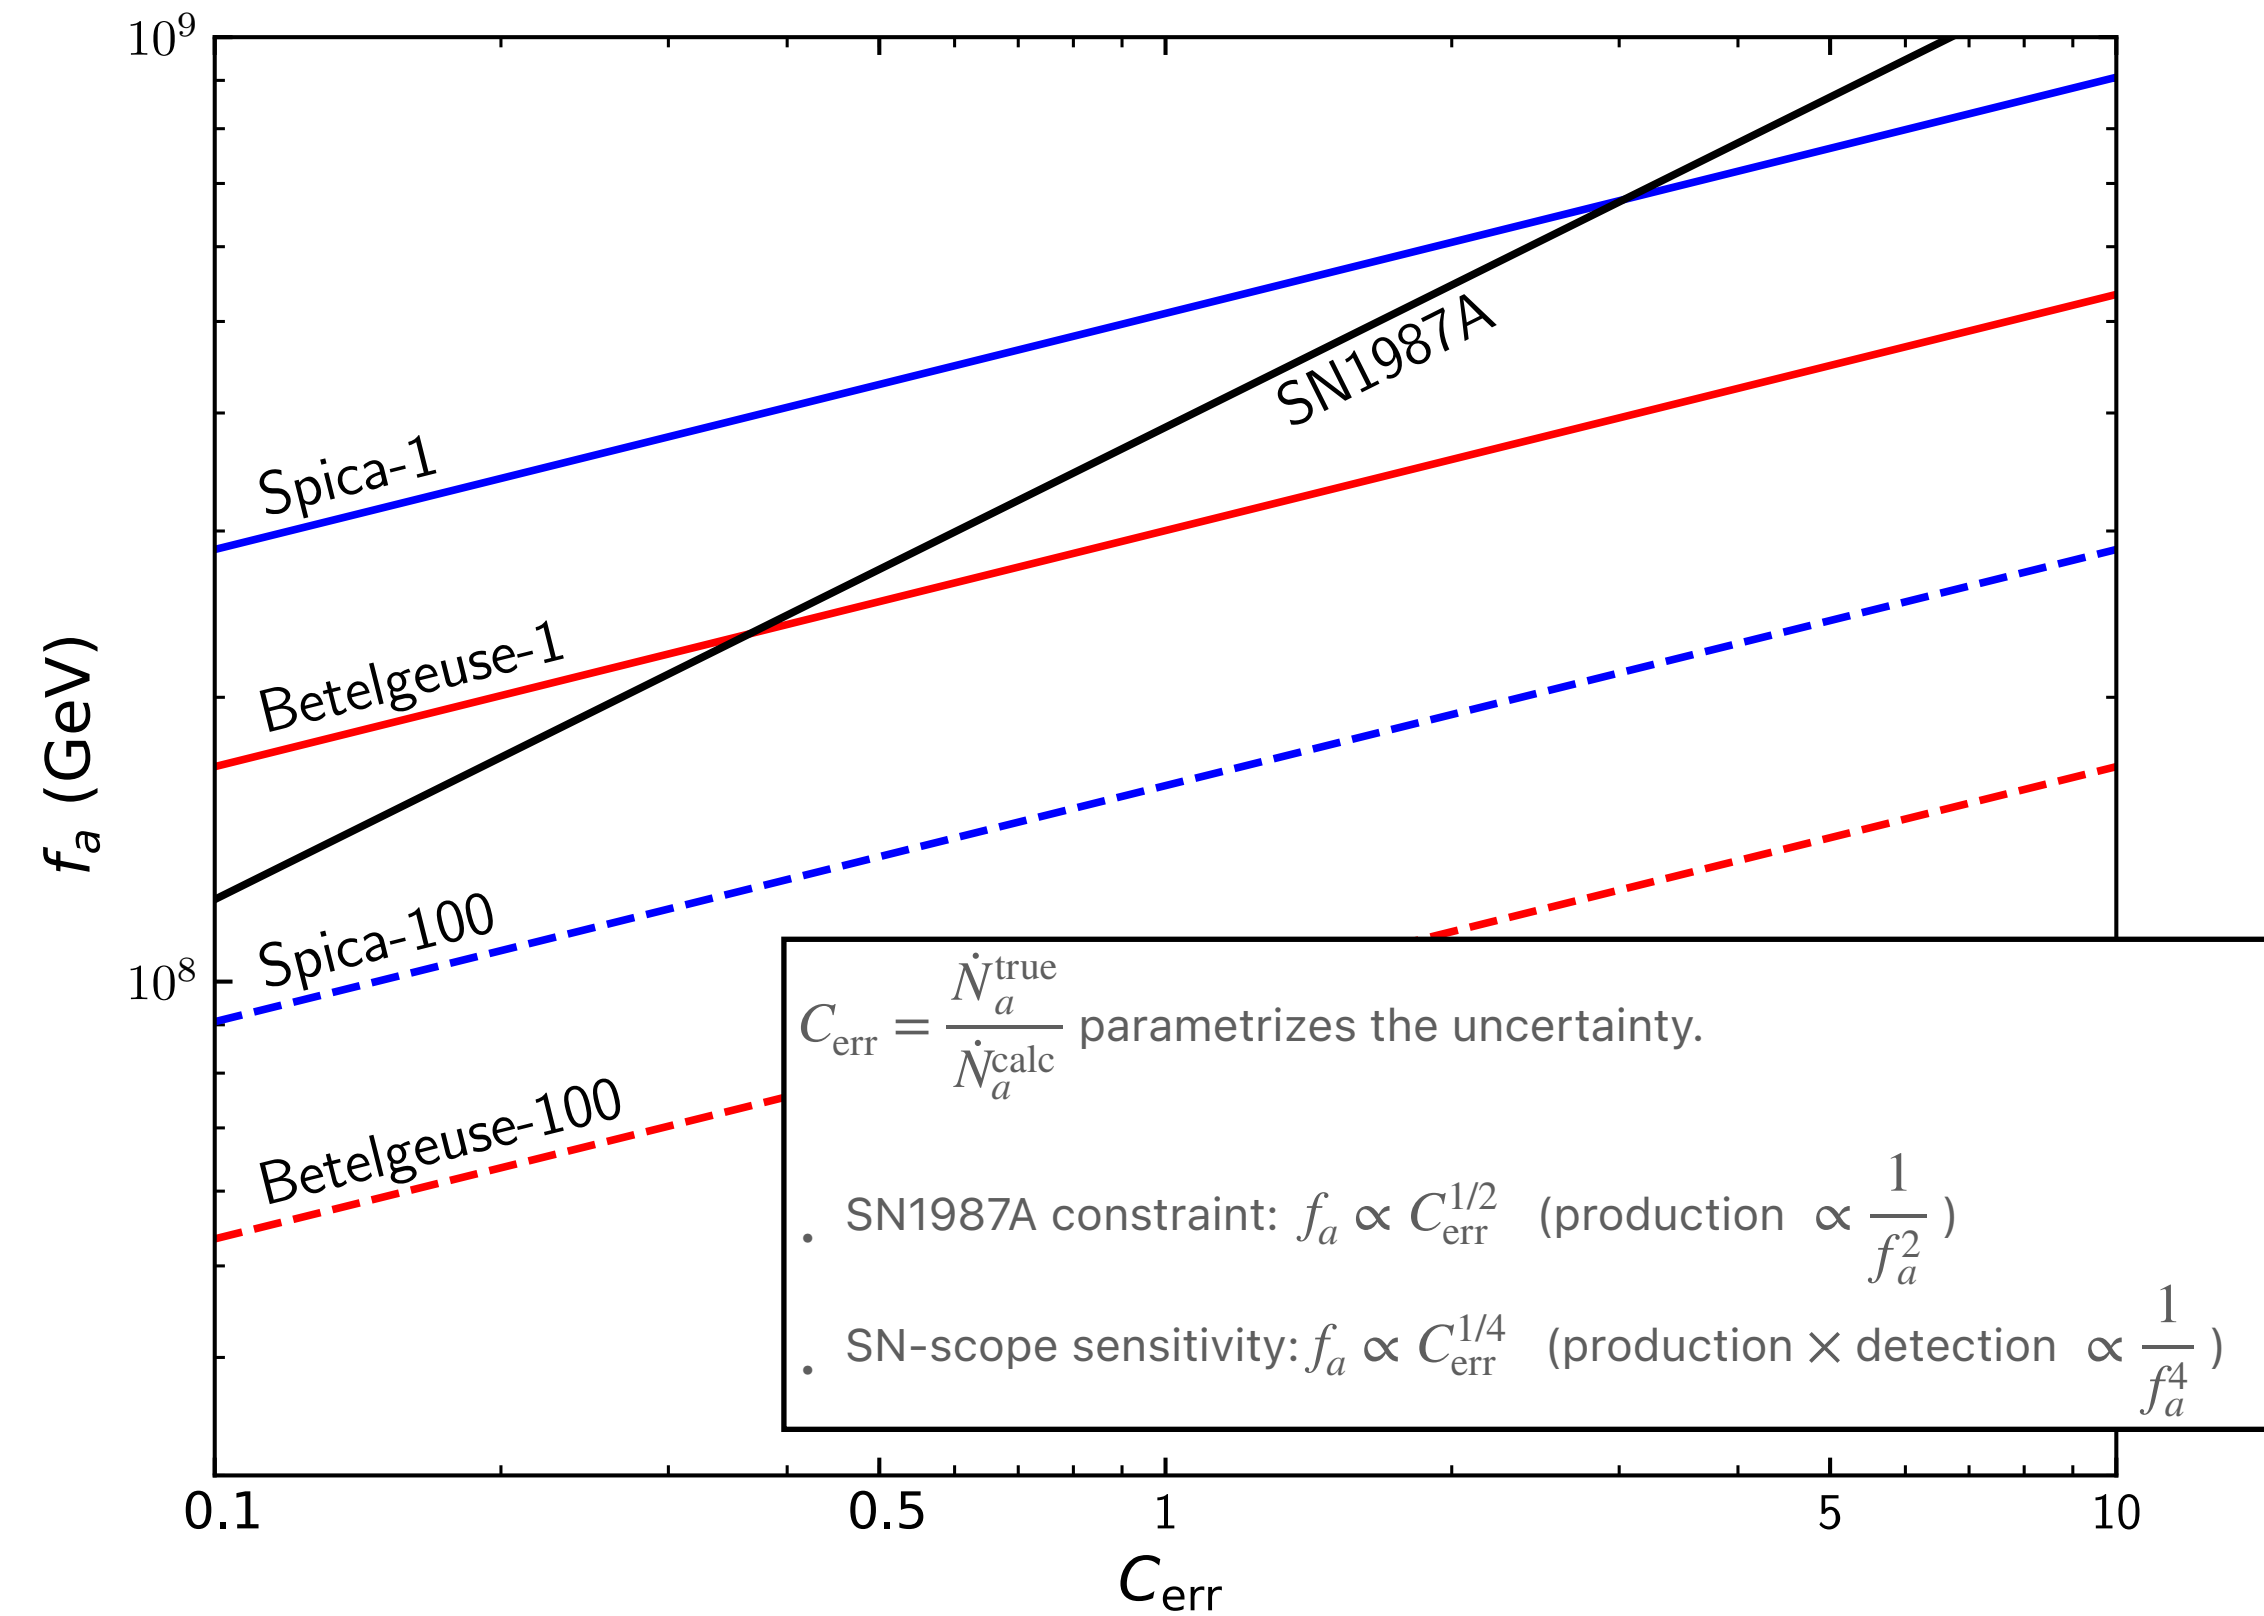

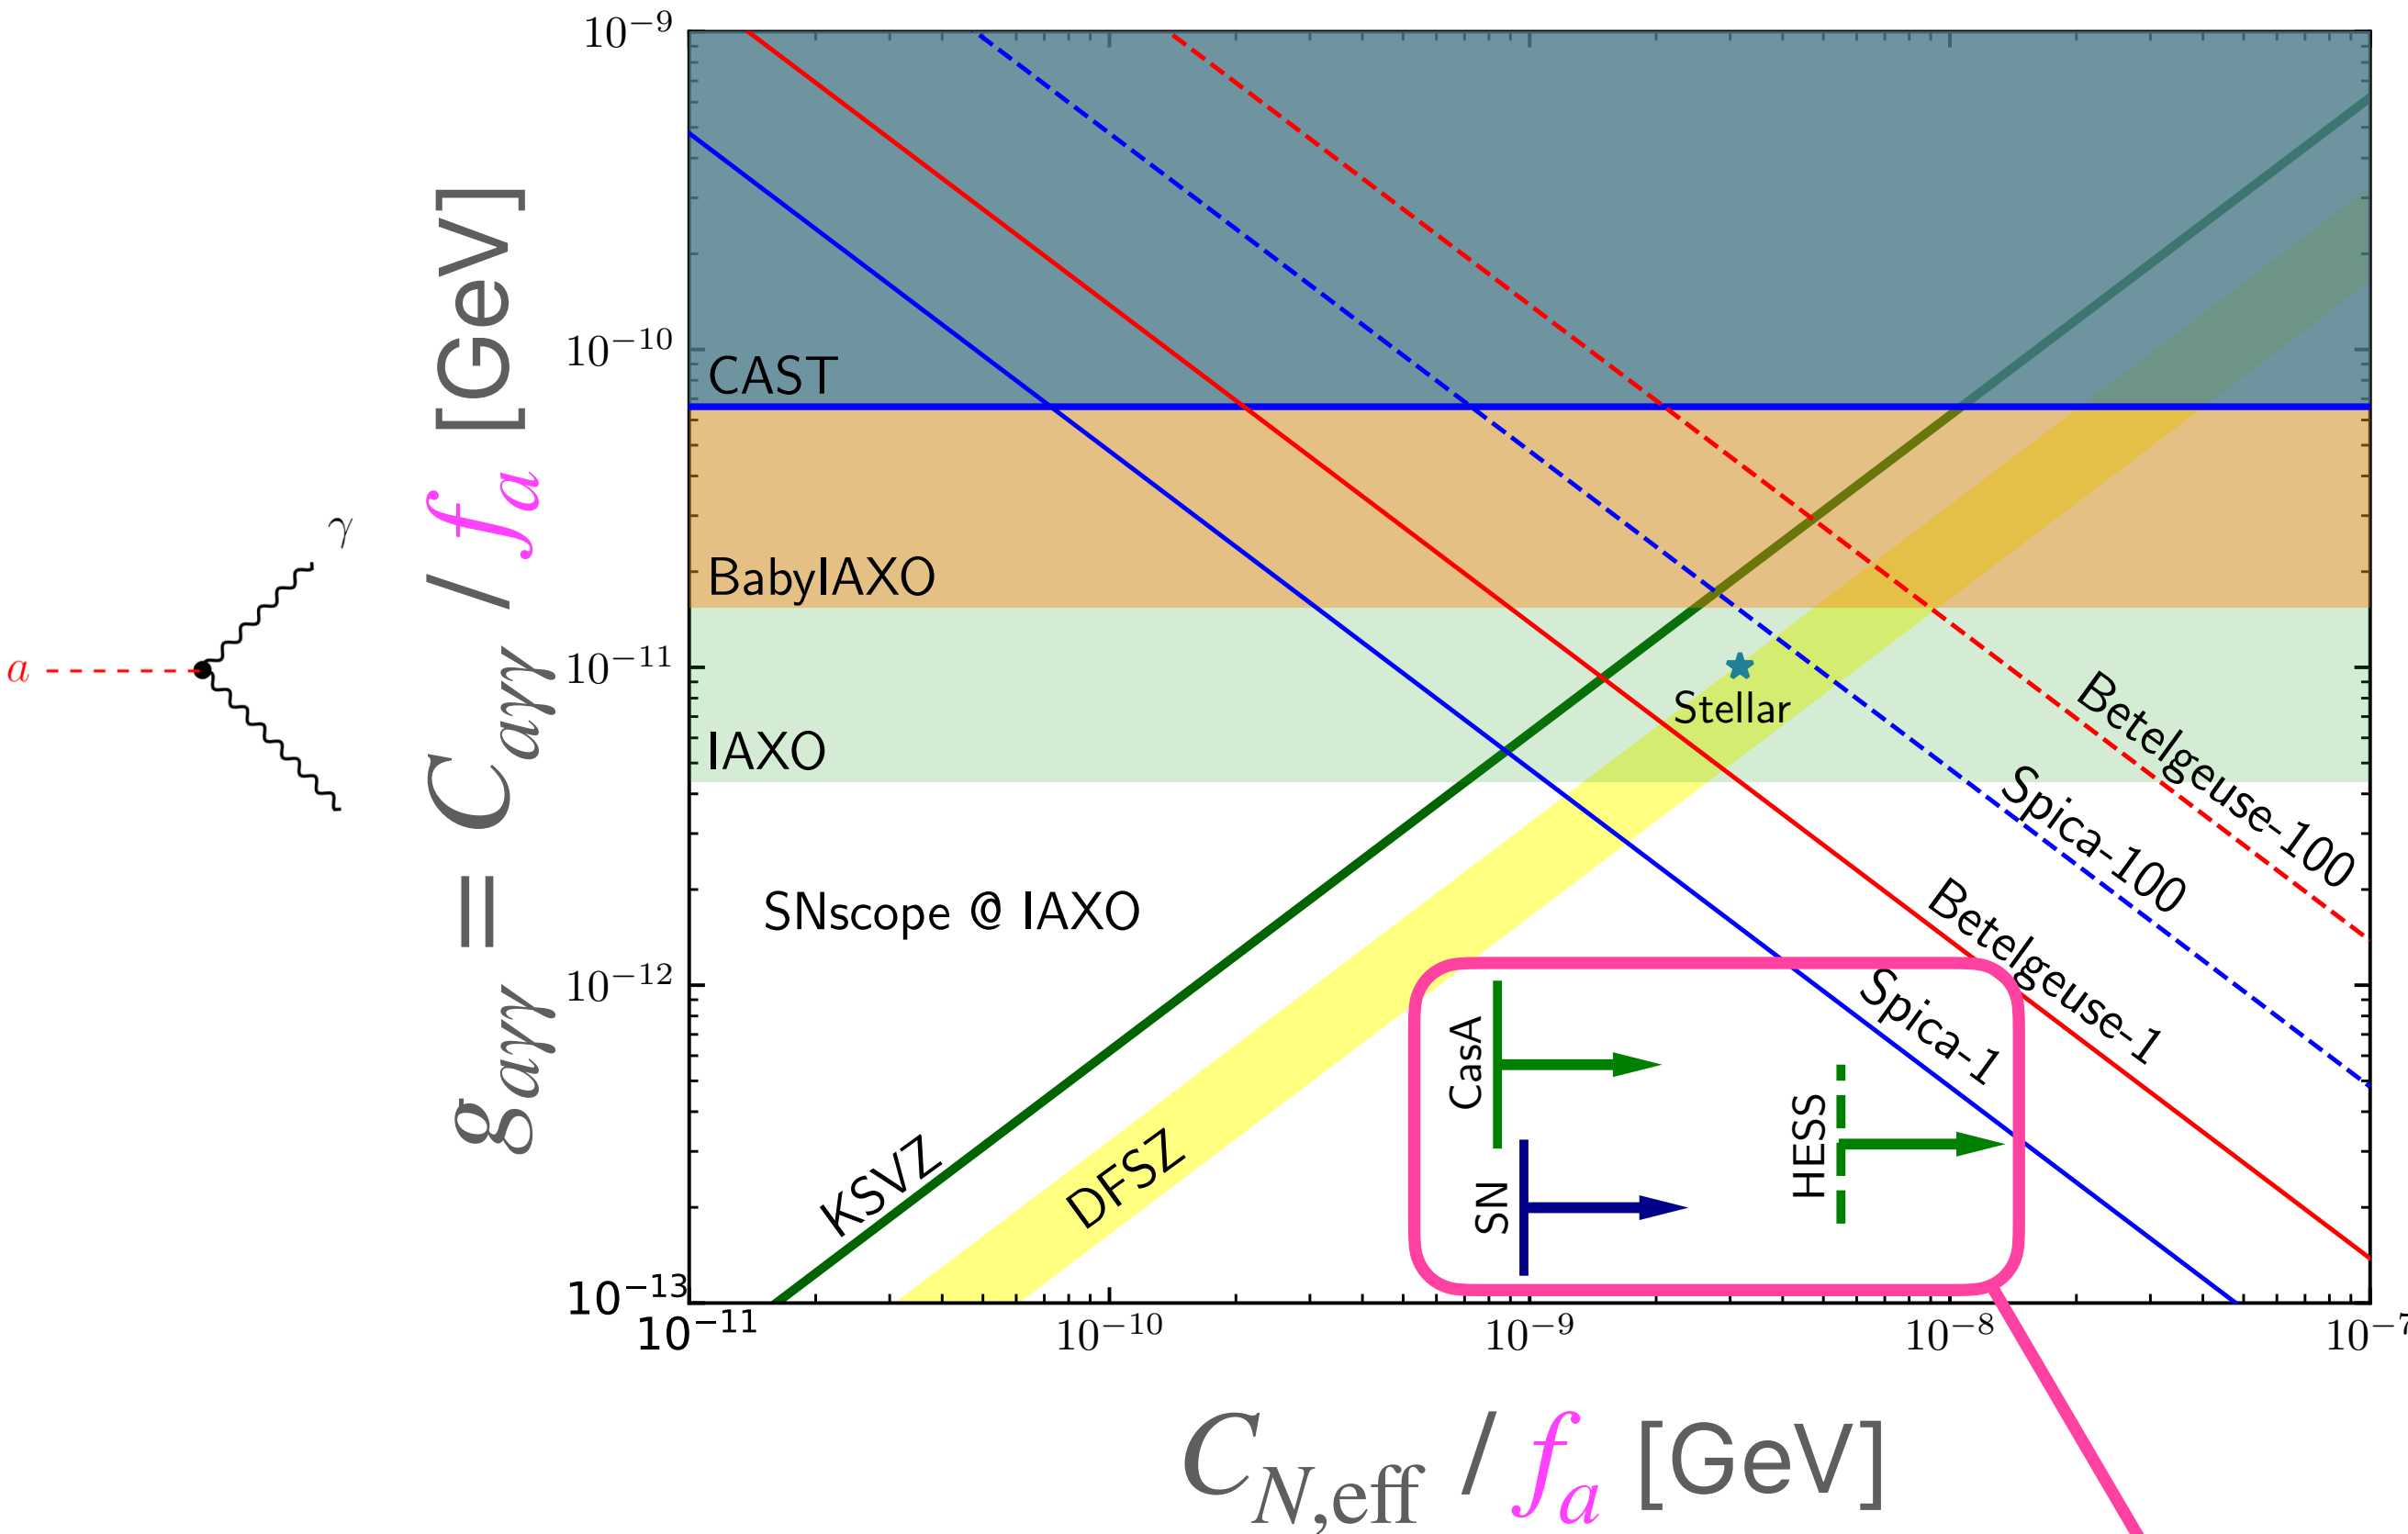

$N_{\text{event}} = 1 \sim 100$   
 for **Betelgeuse** ( $d \simeq 220$  pc)  
 and **Spica** ( $d \simeq 77$  pc)

- Axion coupling: KSVZ model ( $C_{N,\text{eff}} = 0.37$  and  $C_{a\gamma\gamma} = \alpha/\pi$ )
- Axion mass: free parameter (ALPs-like)

- Better sensitivity than helioscopes for large mass, because of higher axion energy ( $E_a^{\text{SN}} \sim 70$  MeV  $\gg E_a^{\text{sun}} \sim$  a few keV).
- For small mass region, both solar axion and SN-axion may be discovered.

# Event number

vs. stellar constraints

$m_a = 10^{-3}$  eV (fixed)

stellar constraints

For  $C_{\text{err}} \simeq 0.1 - 0.3$ ,

- $\mathcal{O}(1)$  events for Betelgeuse,
- $\mathcal{O}(10)$  events for Spica.

# Summary

- If a nearby (< a few 100 pc) **supernova (SN)** occurs, a huge number of **axions** (in addition to neutrinos) may arrive at the Earth.
- Those **SN axions** may be detected by an **axion Supernova-scope** with the help of **pre-SN neutrino alert**.

SN

Similar idea in: G.G.Raffelt, J.Redondo, N.Viaux Maira (2011), I.G.Irastorza, J.Redondo (2018).

- **SN-scopes** based on the next-generation axion helioscopes (such as IAXO) have potential to detect **O(1-100) SN axions**.

[arXiv:2008.03924] JCAP **11** (2020) 059.

S.Ge, K.Hamaguchi, K.Ichimura, K.Ishidoshiro, Y.Kanazawa, Y.Kishimoto, N.Nagata, J.Zheng.

**A nearby SN is so rare — it would be a once in a lifetime opportunity for directly detecting SN axions!**

# Motivation: axion

## Conventional Models

- **KSVZ** axion model [Kim,'79, Shifman, Vainshtein, Zakharov,'80]

$$\mathcal{L} = |\partial\phi|^2 + (\lambda\phi\bar{Q}Q + h.c.) - V(|\phi|)$$

- $Q, \bar{Q}$  : heavy vector-like quarks

- **DFSZ** axion model [Dine, Fischler, Srednicki,'81, Zhitnitski,'80]

$$\mathcal{L} = |\partial\phi|^2 + (\mu\phi H_u H_d + h.c.) - V(|\phi|, H_u, H_d)$$

- 2 Higgs doublet  $H_u, H_d$

---

## cf. Flaxion model

[Ema, Hamaguchi, Moroi, Nakayama,'16, Calibbi, Goertz, Redigolo, Ziegler, Zupan,'16]

$$\begin{aligned}\mathcal{L} = & y_{ij}^d \left(\frac{\phi}{M}\right)^{n_{ij}^d} \bar{Q}_i H d_{Rj} + y_{ij}^u \left(\frac{\phi}{M}\right)^{n_{ij}^u} \bar{Q}_i \tilde{H} u_{Rj} \\ & + y_{ij}^l \left(\frac{\phi}{M}\right)^{n_{ij}^l} \bar{L}_i H l_{Rj} + y_{i\alpha}^\nu \left(\frac{\phi}{M}\right)^{n_{i\alpha}^\nu} \bar{L}_i \tilde{H} N_{R\alpha} \\ & + \frac{1}{2} y_{\alpha\beta}^N \left(\frac{\phi}{M}\right)^{n_{\alpha\beta}^N} M \overline{N_{R\alpha}^c} N_{R\beta} + h.c.\end{aligned}$$

# Motivation: axion

## Conventional Models

- **KSVZ** axion model [Kim,'79, Shifman, Vainshtein, Zakharov,'80]

$$\mathcal{L} = |\partial\phi|^2 + (\lambda\phi\bar{Q}Q + h.c.) - V(|\phi|)$$

- $Q, \bar{Q}$  : heavy vector-like quarks

- **DFSZ** axion model [Dine, Fischler, Srednicki,'81, Zhitnitski,'80]

$$\mathcal{L} = |\partial\phi|^2 + (\mu\phi H_u H_d + h.c.) - V(|\phi|, H_u, H_d)$$

- 2 Higgs doublet  $H_u, H_d$

## cf. **Flaxion** model

[Ema, Hamaguchi, Moroi, Nakayama,'16, Calibbi, Goertz, Redigolo, Ziegler, Zupan,'16]

$$\begin{aligned} \mathcal{L} = & y_{ij}^d \left(\frac{\phi}{M}\right)^{n_{ij}^d} \bar{Q}_i H_{dRj} + y_{ij}^u \left(\frac{\phi}{M}\right)^{n_{ij}^u} \bar{Q}_i \tilde{H} u_{Rj} \\ & + y_{ij}^l \left(\frac{\phi}{M}\right)^{n_{ij}^l} \bar{L}_i H_{lRj} + y_{i\alpha}^\nu \left(\frac{\phi}{M}\right)^{n_{i\alpha}^\nu} \bar{L}_i \tilde{H} N_{R\alpha} \\ & + \frac{1}{2} y_{\alpha\beta}^N \left(\frac{\phi}{M}\right)^{n_{\alpha\beta}^N} M \overline{N_{R\alpha}^c} N_{R\beta} + h.c. \end{aligned}$$

## In all cases, ...

$\phi$  : complex scalar (Peccei-Quinn field)

$U(1)_{PQ}$  ( $\phi \rightarrow \phi e^{i\alpha}$ ) is spontaneously broken

Nambu-Goldstone boson = **Axion**

From anomaly,  $\mathcal{L}_{\text{axion}} \ni \frac{\alpha_s}{8\pi} \frac{a}{f_a} G_{\mu\nu}^a \tilde{G}^{a\mu\nu}$

→ **Strong CP problem is solved.**

The cumulative numbers of expected neutrino events for Fe-Core,  $d = 200$  pc.

cf. The background at KamLAND is low  $\sim 1$  event/day.

**Figure 12.** Normalized number spectra at different times for  $8.4 M_{\odot}$  (left panels),  $12 M_{\odot}$  (middle panels) and  $15 M_{\odot}$  (right panels). Red, blue, green and orange curves correspond, respectively, to  $\bar{\nu}_e$  and  $\nu_e$  from the pair annihilation and  $\bar{\nu}_{\mu}/\bar{\nu}_{\tau}$  and  $\nu_{\mu}/\nu_{\tau}$  from the pair annihilation. All neutrinos have the identical spectrum after normalization for the plasmon decay as shown with black. For better visibility, all the lines but the black one in the left panels are multiplied by the factors indicated. Note that larger  $t$ 's correspond to earlier times.

**Abstract.** The most efficient axion production mechanism in a supernova (SN) core is the nucleon-nucleon bremsstrahlung. This process has been often modeled at the level of the vacuum one-pion exchange (OPE) approximation. Starting from this naive recipe, we revise the calculation including systematically different effects, namely a non-vanishing mass for the exchanged pion, the contribution from the two-pions exchange, effective in-medium nucleon masses and multiple nucleon scatterings. Moreover, we allow for an arbitrary degree of nucleon degeneracy. A self consistent treatment of the axion emission rate including all these effects is currently missing. The aim of this work is to provide such an analysis. Furthermore, we demonstrate that the OPE potential with all the previous corrections gives rise to similar results as the on-shell  $T$ -matrix, and is therefore well justified for our and similar studies. We find that the axion emissivity is reduced by over an order of magnitude with respect to the basic OPE calculation, after all these effects are accounted for. The implications for the axion mass bound and the impact for the next generation experimental axion searches is also discussed.

# A comment on **inverse Primakoff scattering of axion**.

T.Abe, KH, N.Nagata [[2012.02508](#)] PLB 2021

- For low energy ( $\lesssim \mathcal{O}(\text{keV})$ , e.g., solar axion), the **atomic form factor** is important.

e.g., one of the interpretations of the XENON1t excess.

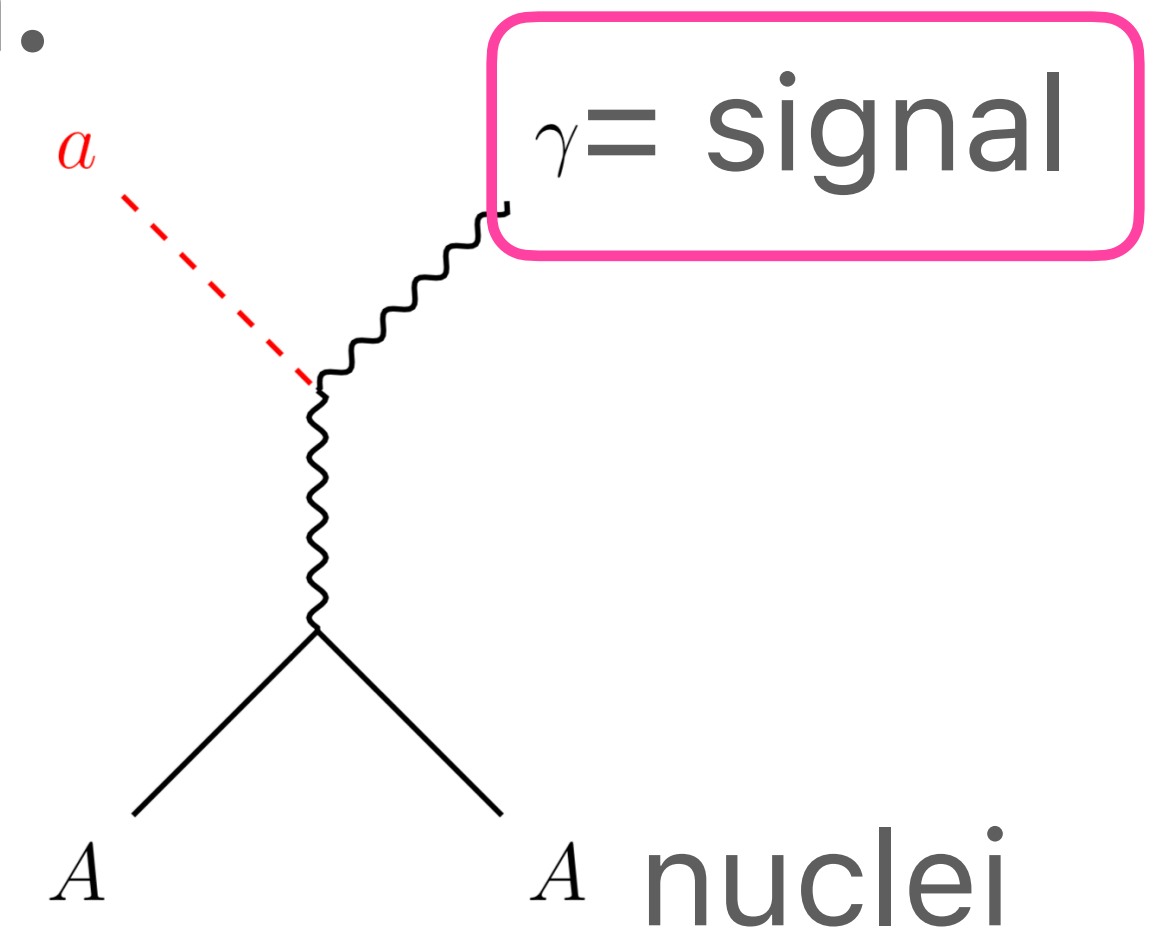

# A comment on **inverse Primakoff scattering** of axion.

T.Abe, KH, N.Nagata [[2012.02508](#)] PLB 2021

- For low energy ( $\lesssim \mathcal{O}(\text{keV})$ , e.g., solar axion), the **atomic form factor** is important.

e.g., one of the interpretations of the XENON1t excess.

- Previous studies used a naive screened Coulomb potential.

- We **reevaluated the cross section** with a realistic form factor that is computed with a relativistic Hartree-Fock wave function.

- The scattering cross section was overestimated by more than an order of magnitude for axions with  $< \mathcal{O}(10)$  keV energies.

- We also discussed the importance of the **inelastic scattering** for low energy.
