Contribution ID: 37

Type: **Talk**

## Recent highlights of top-quark cross section and properties measurements with the ATLAS detector at the LHC

*Wednesday 19 July 2023 12:05 (15 minutes)*

The remarkably large dataset collected with the ATLAS detector at the highest proton-proton collision energy provided by LHC allows to use the large sample of top quark events to test theoretical predictions with unprecedented precision. Recent measurements of total and differential top-quark cross sections as well properties of top-quark production are presented, including new measurements of top-quark pair production and single-top production at 5 and 13 TeV as well as first measurement of the 13.6 TeV cross-section of  $t\bar{t}$  events. Further highlights are the new measurements of angular properties such as the W-boson polarisation in  $t\bar{t}$  events, new top-quark mass measurements as well as distributions sensitive to colour reconnection. Several measurements are interpreted within the Standard Model Effective Field Theory, yielding stringent bounds on Wilson coefficients.
