

# 31st International Symposium on Lepton Photon Interactions at High Energies

Contribution ID: 40

Type: **Talk**

## ATLAS New Small Wheel Performance Studies with first data of LHC Run3

*Wednesday 19 July 2023 11:50 (15 minutes)*

After successfully completing Phase I upgrades during LHC Long Shutdown 2, the ATLAS detector is back in operation with several upgrades implemented. The most important and challenging upgrade is in the Muon Spectrometer, where the two inner forward muon stations have been replaced with the New Small Wheels (NSW) system featuring two entirely new detector technologies: small strip Thin Gap Chambers (sTGC) and the Micromegas (MM). Following the massive build, test and installation work in ATLAS, the two endcap NSW were used in the first collision data period in 2022 participating in the Muon Spectrometer tracking system, at the same time completing the phase of commissioning of this completely new system. A huge effort has gone into the operation of the new data acquisition system, as well as the implementation of a new processing chain within the muon software framework. The new detectors are fully integrated into the software. Tracking is performed with full consideration of the absolute alignment of each individual detector module by the ATLAS Muon Spectrometer optical alignment system. All the deviations from the nominal geometry of all the constituent elements of each sTGC and MM module are accounted for through the modeling of the real chamber geometry reconstructed from the information of the construction databases. After an overview of the software implementation and the strategies adopted for the simulations and reconstruction, the studies on the performance of the NSW system from the first months of 2022 RUN3 data taking will be reported.
