

# Use for Group Production

- Group production efforts successful this year.
  - Running for many different groups in ATLAS, producing data for analysis in a timely manner.
  - Already the amount of production is larger than the reprocessing efforts.
- Need to assume this will grow in 2011
  - More groups, more data, more outputs.
- Things rather chaotic in past year, different task, release, output for each group.
  - Each production requires another run over mostly the same set of inputs.
- Should this be combined? Putting all group production into one production.
  - One run over the input data, with many outputs. Less data transfer to get jobs going.
  - Periodic run schedule, sets of groups as ready run over data with one common release. A few of these productions per year.
- And the end Junji will run as Junji wants, but should there be a push from production system to get groups coordinated for a better use of resources?
