

# Radiation monitoring & analysis: Overview of 2021 prompt radiation levels in the injector chain

Kacper Bilko (SY-STI-BMI),  
Diego Di Francesca (EN-EL-FO),  
Ruben Garcia Alia (SY-STI-BMI)

On behalf of the MCWG team

Special thanks to groups responsible for the radiation monitors  
(SY/BI-BL, EN/EL-FC, BE-CEM)

R2E annual meeting – 1<sup>st</sup> March 2022  
<https://indico.cern.ch/event/1116677/>

# Outline

---

- Introduction:
  - R2E and the related radiation monitoring & analysis activity,
  - Quantities for characterizing the radiation used by R2E ,
  - Overview of the radiation detectors used by R2E,
  - Automated analysis workflow,
  - Radiation Levels Dashboard,
- Highlights from the 2021 injector radiation levels as the example of the radiation monitoring activity within R2E,
- Recent (2022) radiation levels as measured in PSB and PS,
- Conclusions.

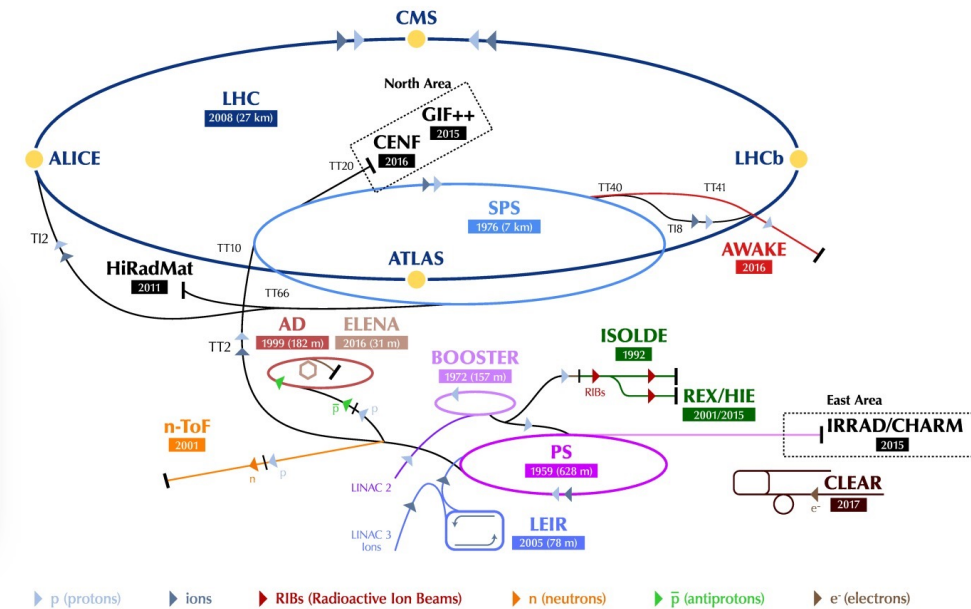

# Introduction: Radiation to Electronics project

**Continuous losses** during accelerator operation create **mixed radiation fields** in the tunnels and adjacent caverns.

**Radiation can negatively impact the lifetime and the functionality** of the accelerator components, including electronics. This might lead, in the worst case, to the downtime of an accelerator.

The CERN accelerator complex

## LHC ARCs

## LHC DSs

## SPS LSS2 – North Area extraction

# Introduction: Overview of the radiation detectors used by R2E

## Optical Fiber Dosimeters:

- Developed, deployed and operated within R2E by EN-EL-FO,
- TID profile along cable trays in the injectors,
- Our use: detailed (1 m resolution) **information about radiation profile along the injectors,**

- [See Diego's talk,](#)

## RadMONs:

- Dedicated R2E monitors (operated by BE-CEM-EPR),
- Measure 4 main R2E quantities,
- Our use: **characterization and monitoring of radiation fields** (mainly in the vicinity of the electronic equipment),

- [See Salvatore's talk,](#)

## Beam Loss Monitors (Ionization Chamber type):

- Main use: Machine Protection (interlocking),
- Our use: **analysis of TID,**

## High Level Dosimetry:

- Radio-Photo-Luminescence dosimeters (RPL),
- Passive measurements,
- Our use: **deployed on demand in high radiation locations,** where other monitors not suitable,

- [See Ygor's talk,](#)

# Introduction: Overview of the radiation detectors used by R2E

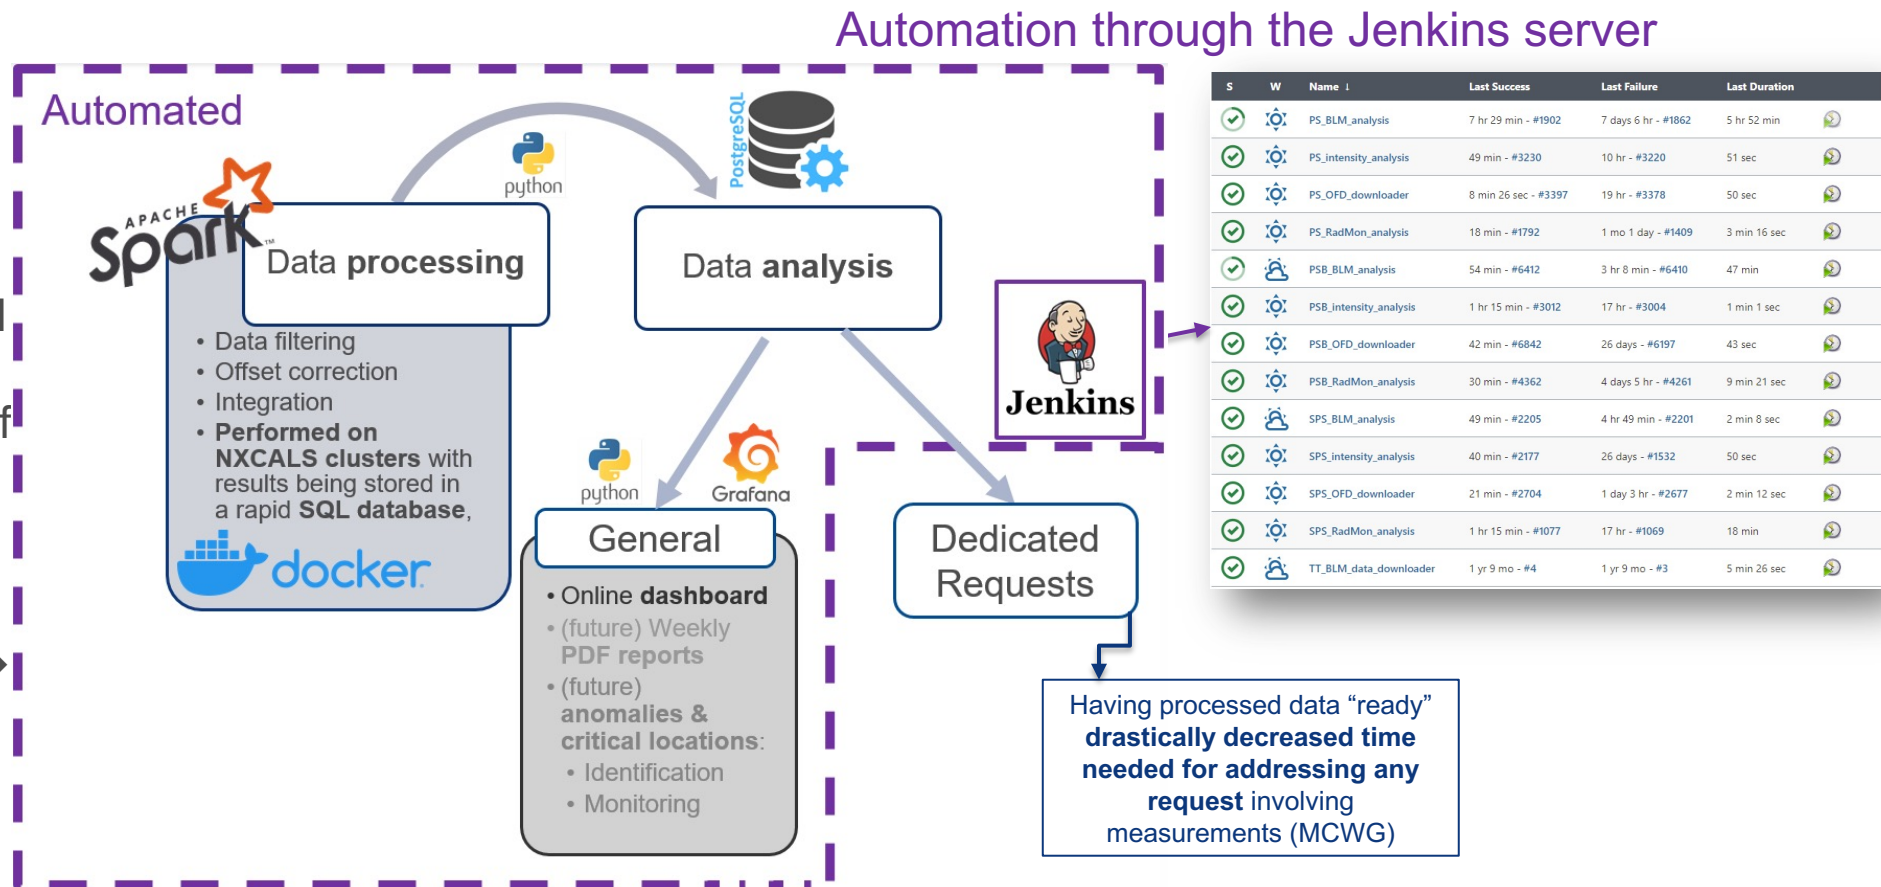

- Each type of the monitors has its own advantages (e.g. vicinity of the equipment, time or spatial resolution),
- Different detector types result in different challenges:
  - Data volume,
  - Time resolution,
  - Spatial resolution,
- Goal: provide complementary view on the radiation levels based on **all available radiation detectors**,

	Optical Fibre Sensing	Beam Loss Monitors (standard Ion. Chamber)	RadMONs	High Level Dosimetry
PSB	Continuous 1D profile along the cable tray	34	8 units	on request
PS	Continuous 1D profile along the cable tray	100 units	16 units	on request
SPS	Continuous 1D profile along the cable tray	~270 (non-LIU type) units	~60 units	on request
LHC	DS regions (IP 1/5/7)	~3600 units	~400 units	on request
Measured quantities	TID	TID	TID; HEH-eq-, 1-MeV-eq-, Th-n-eq-fluences	TID
Detection range	1 Gy – 2 kGy	very good, depends on the monitor	1 Gy - 200 Gy (10 kGy)	0.1 Gy - 5 MGy
Time resolution	~days (depends on the accelerator)	1 ms (PS/PSB), ~cycle (SPS)	~hour	passive measurement
Main advantage	Continuous 1D profile → high spatial resolution (1 m)	high time resolution (cycle)	Measures main R2E-relevant quantities	High dynamic range of measurements

# Introduction: Analysis workflow

- Processing more than 100 GB per day → feasible thanks to NXCALS,
- Dedicated user requests are handled much faster as the time-consuming part of the analysis is automated,
- Results stored in the rapid SQL database → online monitoring possible → Grafana dashboard,

# Radiation Levels Dashboard

- Available at <https://r2e-monitoring.web.cern.ch/>,
- Great tool for gaining **insights about the radiation levels** in the largest CERN's accelerators (PSB, PS, SPS, LHC),
- Covers:
  - Operational statistics (intensity, beam user breakdown),
  - Radiation levels reported by:
    - Beam Loss Monitors,
    - RadMONs,
    - Distributed Optical Fiber Sensing.

# Highlights from 2021 operation

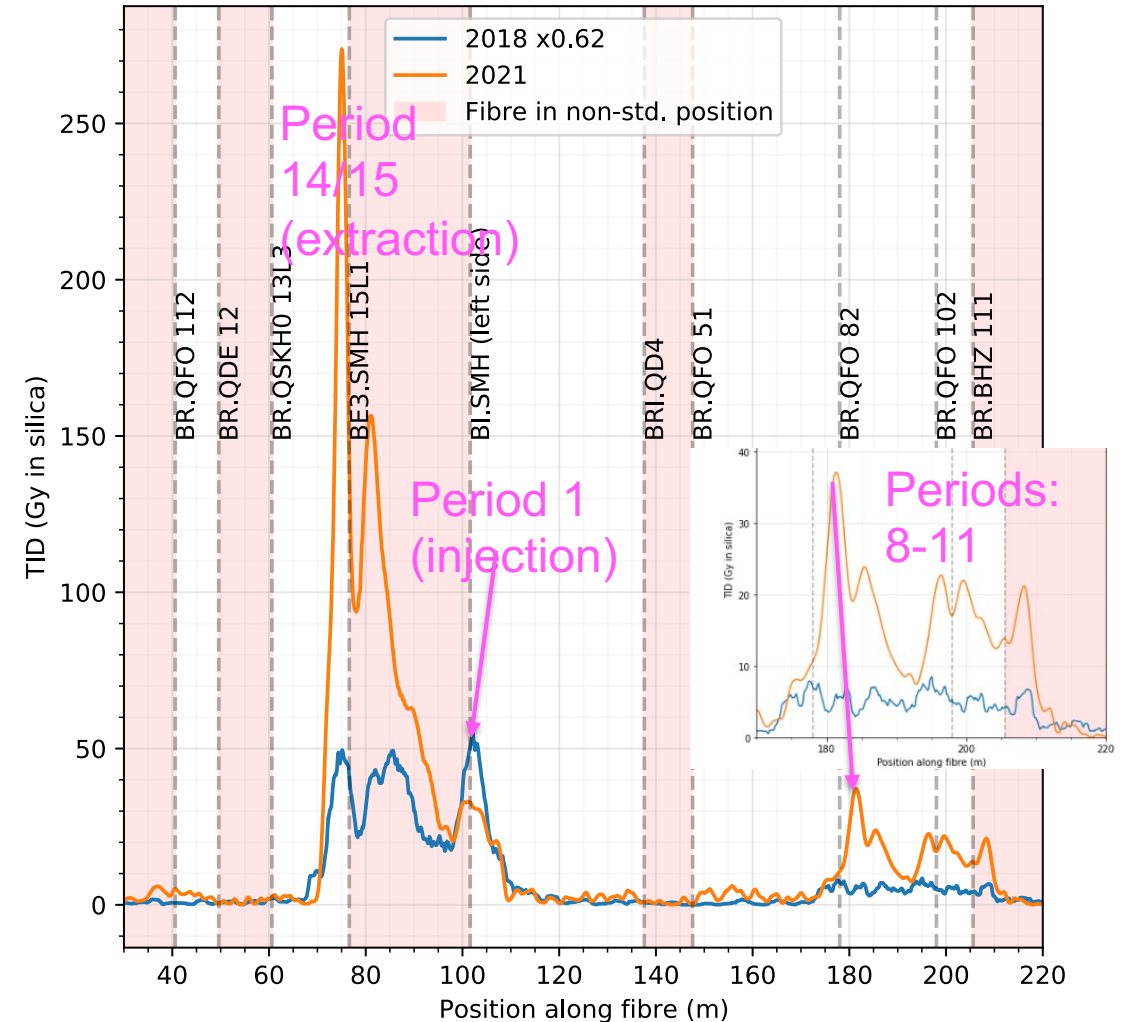

# PSB: TID measurements from Beam Loss Monitors (standard IC-type)

- Among measurements by **the rings BLMs**, the highest values were observed in the:
  - injection region (period 1) - up to 430Gy,
  - extraction region (period 15) - up to 240Gy.
- It's important to highlight that the respective BLM locations differ (inner/external side and observed rings).

# PSB: Optical Fibre TID measurements in 2018 and 2021

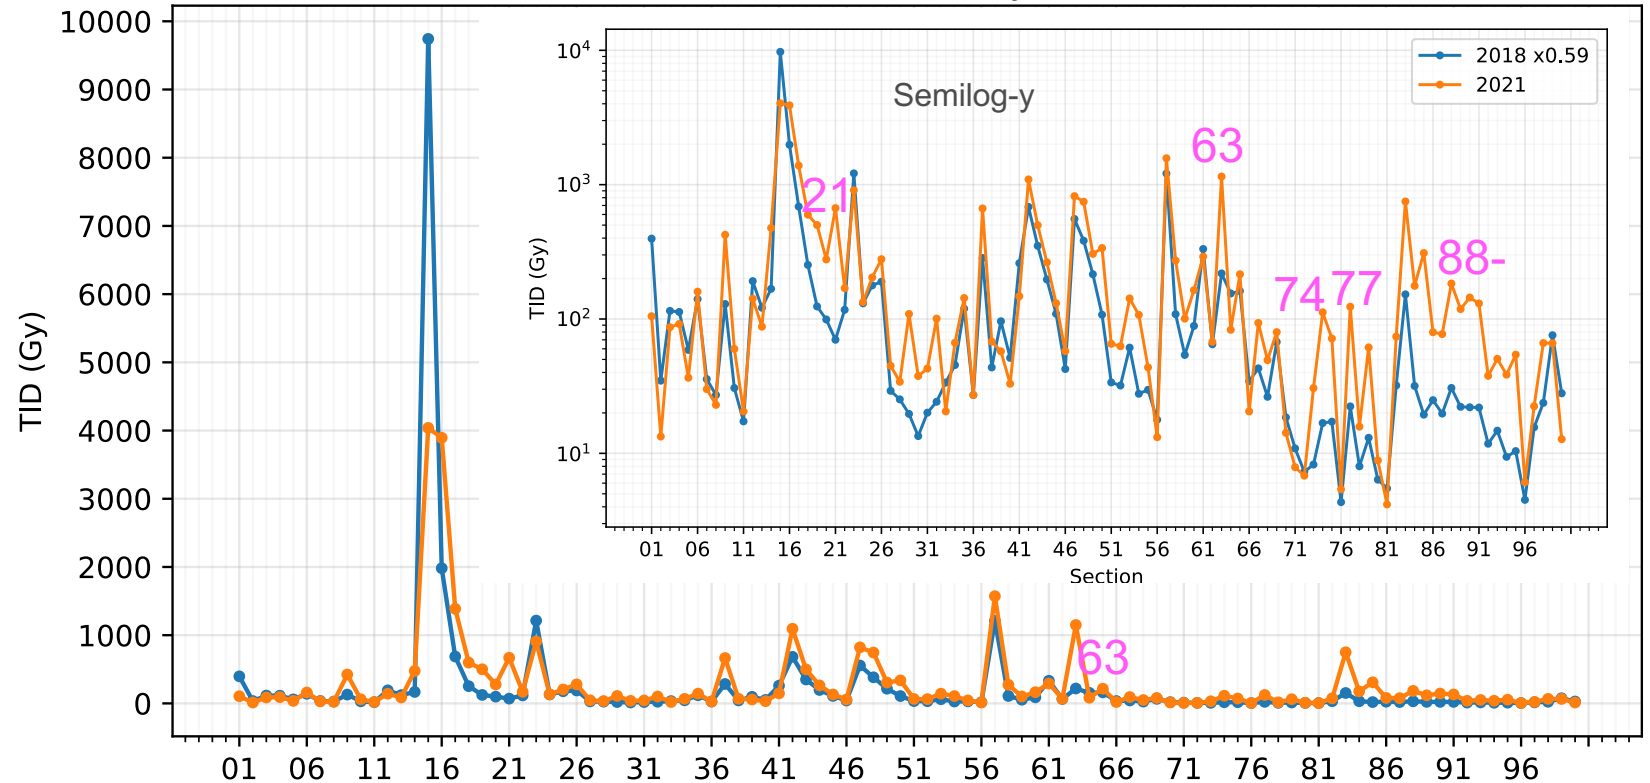

- **2018 TID values multiplied by 0.62** (ratio of injected intensity in 2021 with respect to 2018),
- Extraction region:
  - **Increase by factor ~5 with respect to 2018** (norm. TID levels),
- Injection region:
  - **Decrease by ~40%** in comparison to 2018 (norm. TID),
  - As opposed to 2018, **no longer the dominating region** in terms of prompt radiation levels,
- Periods 8-11:
  - Changed radiation pattern,
  - Increase by up to factor ~5 with regard to 2018 (norm. TID levels),

# PS: Total Ionizing Dose measured by the Beam Loss Monitors

- Overall, measured normalized TID levels in 2021 were higher in majority of the PS sections.
- Selected sections with significant increase wrt 2018:
  - Section 21 (increase x5):**
    - nTOF-cycles dominated,
  - S. 63 (increase by factor ~5 wrt 2018):**
    - East Area cycles dominated,
  - S. 74 and 77 (increase by a factor 5-7),
  - S. 83-95 (increase by a factor 5-16):
- Observed decrease (norm. TID) by factor ~2.5 in section 15.

TID levels measured by the BLMs

Relative contribution of different USERS to the TID in each section

# PS: Optical Fiber TID measurements in 2018 and 2021

- Similarly as for BLM measurements, in 2021 the normalized levels measured by the Optical Fiber (at the cable try) were higher in the majority of the sections.
- Sections with the most significant differences:
  - In **section 21** the measured normalized TID levels were ~6x higher,
  - In **section 63**, the normalized levels were x3 higher,
  - In **section 85** the measured normalized levels were ~5x higher,

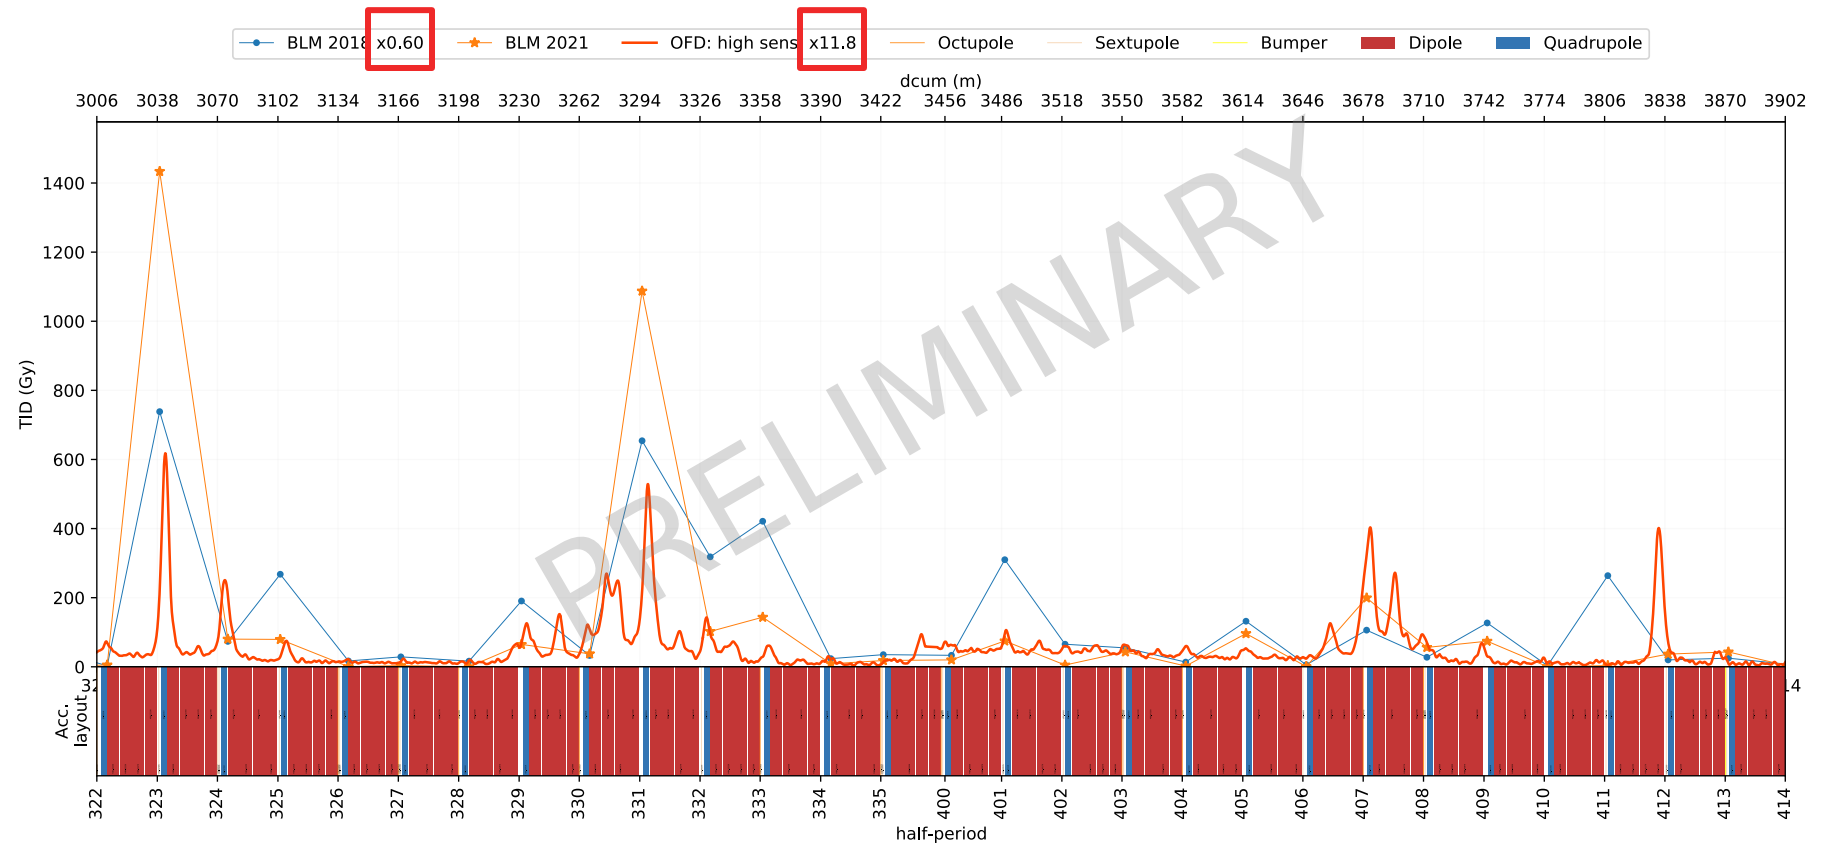

# SPS: ARC34 as an example of the SPS radiation monitoring

- 2021 – the first year with the **DOFRS operating along the SPS:**

- will be covered in detail by [Diego's talk](#),
- high spatial resolution of measurements,
- BLMs cover only Quadrupole locations (ARCs), whereas with the fibre the continuous profile along all magnets is retrieved (also along MBs),

- Consistency between measurements reported by the available detectors:**

- Detailed benchmarks are ongoing.

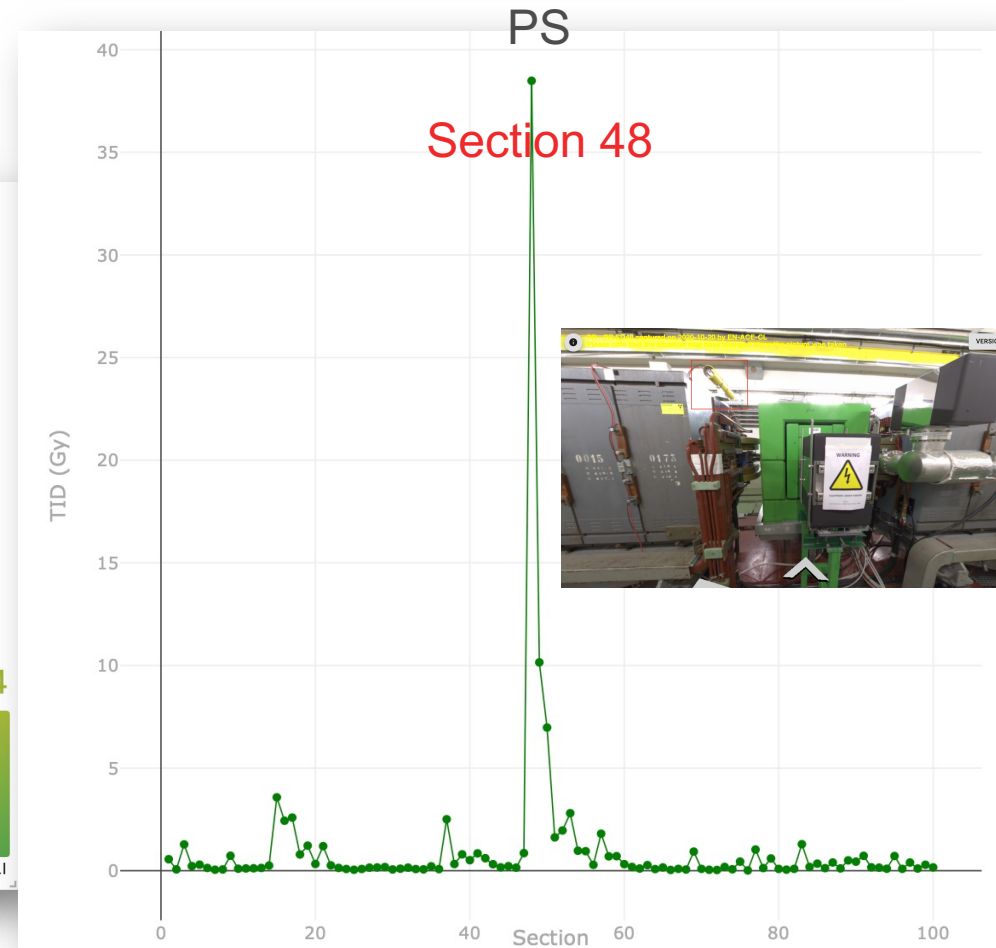

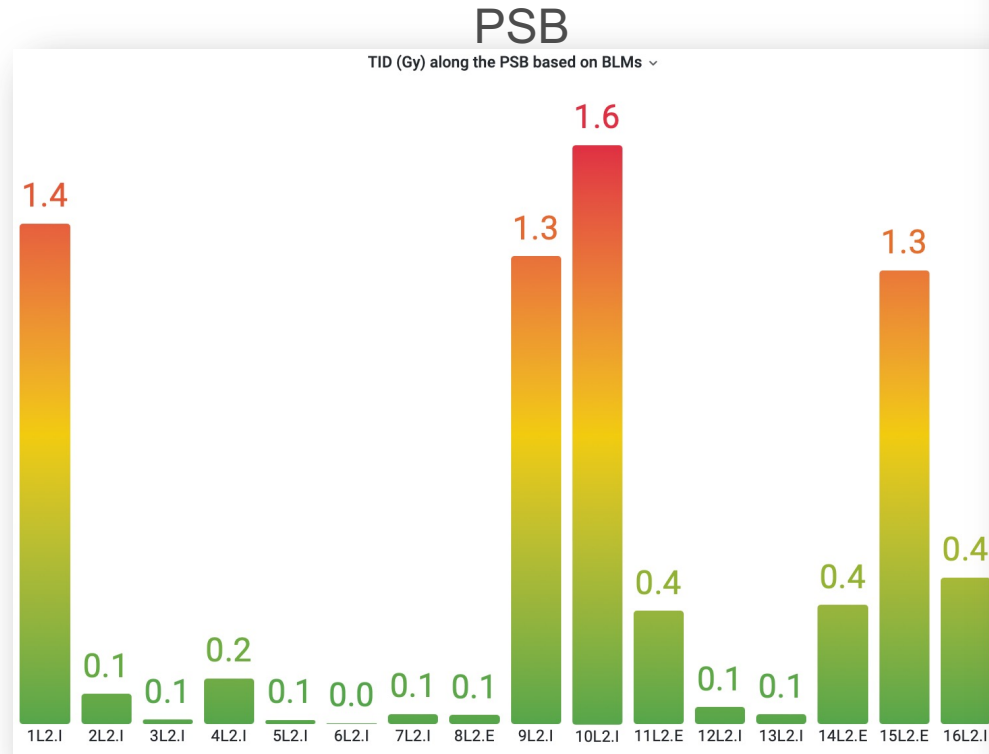

# SPS: Radiation Levels in ARC61

- In majority of the locations, the **normalized 2021 radiation levels in SPS decreased as compared to 2018**,
- However there were **few exceptions**, e.g.:
  - In half-period **634** increase by a factor **~10** as compared with 2018 normalized TID levels:
    - 93% of TID from SFT cycles,
  - 110/111:
    - Approximately 60% of the TID from MD cycles,
    - Most of the TID accumulated in June 2021,
- More details presented at [the IPP meeting](#).

# New! Highlights from 2022 operation

- With the implemented solutions, the **radiation levels can be retrieved almost in real-time,**
- Very recent data!**
  - Recommissioning of the injectors after YETS,
  - Period between 21<sup>st</sup> and 28<sup>th</sup> of February 2022 considered,
- PS: up to 40Gy at the BLM close to internal beam dump,
- PSB: up to 2Gy at the BLMs in period 10.

# Conclusions

---

- Radiation monitoring is a core ingredient in **preventing R2E driven accelerator failures**, whereas the related analyses are essential for the **radiation risk assessment** concerning future electronics installations,
- Processing of huge datasets, **more than 100 GB/day**, possible thanks to the implemented framework and opportunities that **NXCALS** (with Apache Spark) introduced,
- **Milestone achieved**: 2021 was the first year with the full R2E automated radiation monitoring in the injectors covering the most relevant radiation monitors:
  - this R2E activity was **essential for MCWG**, and therefore to the equipment groups,
  - additionally, the **analyses were useful for Operations** (beyond MCWG) for
- **Objectives for 2022**:
  - A restart of the **automated radiation monitoring together with the LHC**,
  - Exploitation of the data with the goal of providing insights not only to the equipment groups, but also, to the Operations.

Thank you for  
your attention!
