

# Search for Higgs boson pair production in the $bb\tau\tau$ final state with the ATLAS detector

RENAFAE Workshop 2022

Marisilvia Donadelli - University of Sao Paulo

# Search for HH production - SM

$$\mathcal{L} = -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} + i\bar{\psi}\not{D}\psi + \psi_i Y_{ij} \psi_j \phi + \text{h.c.} + |D_\mu\phi|^2 - V(\phi)$$

$$V(\phi) = -\mu^2\phi^2 + \lambda\phi^4$$

- HH final states search within the **Standard Model**
- SM predicts trilinear Higgs self-coupling  $\lambda_{HHH}$
- Direct probe of electroweak symmetry breaking potential

$$\sigma_{\text{ggF}}^{\text{SM}}(HH) = 31.05_{-23\%}^{+6\%} (\text{scale} + m_{\text{top}}) \pm 3.0\% (\text{PDF} + \alpha_s) \text{ fb}$$

$$m_H = 125 \text{ GeV} \text{ and } \sqrt{s} = 13 \text{ TeV}$$

- ggF dominant production mode at LHC
- $\sigma_{\text{ggF}}(\text{pp} \rightarrow \text{HH})$  small due to destructive interference between top quark loop and HH self-coupling diagrams
  - about 1000 times smaller than that of single Higgs bosons
- Major goal of HL-LHC: measure HH cross section and trilinear self-coupling  $\lambda_{HHH}$

# Search for HH production - anomalous couplings

- LHC experiments are currently not sensitive to SM HH production
- Non-resonant searches can be already sensitive to BSM effects on HH physics
  - HH final states search within **anomalous couplings**
  - sensitive to anomalous deviations of the coupling strength  $\kappa_\lambda = \lambda_{HHH}/\lambda_{HHH}^{SM}$
- **Higgs boson trilinear self-coupling modifier  $\kappa_\lambda$**  has large impact on cross section and kinematics

[JHEP06\(2019\)066](#)

# Search for HH production - SM

- Next leading production mode is Vector-Boson-Fusion (VBF)
- sensitive to  $\kappa_\lambda$  and to quartic VVHH coupling ( $\kappa_{2V}$ )

$$\sigma_{\text{VBF}}^{\text{SM}}(HH) = 1.73_{-0.04\%}^{+0.03\%} \text{ (scale)} \pm 2.1\% \text{ (PDF} + \alpha_s) \text{ fb.}$$

# Search for HH production - BSM

Resonant production

- HH final states search within **Beyond-the-Standard-Model resonances**
- Several BSM models predict existence of heavy particles decaying into 2 Higgs bosons
- Spin-0 resonance: predicted by Two-Higgs-Doublet Models (e.g. MSSM) and Electroweak Singlet Models
- Spin-2 resonance: Kaluza-Klein graviton, predicted in the Randall-Sundrum model of warped extra dimensions

# HH experimental signatures

- Analyses challenge: compromise between BR and higher purity. No golden channel!!
- Variety of final states
- Hbb highest BR
- Leptonic final states: high background suppression
- Dominant production modes and different regimes are considered

gluon-gluon fusion (ggF)

vector boson fusion (VBF)

$$HH \rightarrow bb\tau_{\text{had}}\tau_{\text{had}}$$

$$HH \rightarrow bb\tau_{\text{lep}}\tau_{\text{had}}$$

# Analysis Strategy

[ATL-CONF-2021-030](#)

- $bb\tau\tau$  has the 3<sup>rd</sup> largest BR of accessible channels
  - challenging  $\tau_{\text{had}}$  reco and triggering
  - neutrinos in  $\tau$  decays
- lephad:  $\tau_{\text{lep}} \tau_{\text{had}}$  (46%)
- hadhad:  $\tau_{\text{had}} \tau_{\text{had}}$  (42%)
- non-resonant and resonant (251-1600 GeV) analyses

## Main backgrounds:

- true- $\tau$  :  $t\bar{t}$  and  $Z$ +heavy flavour
- single H contributions
- fake- $\tau$

| Channel      | Triggers                               | Properties                                      |
|--------------|--|---|
| HadHad       | single- $\tau$ and di- $\tau$ triggers | high purity                                     |
| LepHad (SLT) | single-lepton trigger                  | high acceptance, large $t\bar{t}$ background    |
| LepHad (LTT) | lepton+ $\tau$ trigger                 | lower $p_T^\ell$ increases low-mass sensitivity |

obs  $\kappa_\lambda$  excluded outside the interval [-2.4, 9.2]

The theory prediction curve represents the scenario where all parameters and couplings are set to their SM values except for  $\kappa_\lambda$ . Expected limits assume no HH production.

# Combining ATLAS results

ATL-CONF-2021-052

$b\bar{b}\gamma\gamma$  and  $b\bar{b}\tau\tau$  full Run 2 analyses combination

- current most stringent limits on HH signal strength and  $\kappa_\lambda$
- **obs (exp) 3.1 (3.1)  $\times \sigma_{SM_{HH}}$**
- **obs (exp):  $-1.0 (-1.2) < \kappa_\lambda < 6.6 (7.2)$**

## Resonant (Spin-0): $b\bar{b}b, b\bar{b}\gamma\gamma$ and $b\bar{b}\tau\tau$

- complementarity between channels allows to obtain optimal exclusion across  $m_\chi$
- largest excess at  $m_\chi = 1.1$  TeV: **local (global) excess of  $3.2\sigma$  ( $2.1\sigma$ )**

# Why are EFTs interesting for HH production?

- The Effective Field Theory (EFT) framework can be used as a tool to:
  - make a more general measurement of the Higgs self-coupling
  - explore Beyond-the-Standard-Model scenarios produced at  $E \gg E_{\text{LHC}}$

[ATL-CONF-2021-052](#)

- HH searches present constraints on  $\kappa_\lambda = c_{hhh} / c_{hhh}^{\text{SM}}$  while assuming that all other couplings have their SM values (kappa framework)
- Two frameworks are available in HH:
  - Higgs EFT: Higgs is a singlet (more general)
  - SM EFT: Higgs is a doublet (more SM-like)

# ggF HH - HEFT interpretation

[ATL-PHYS-PUB-2022-019](#)

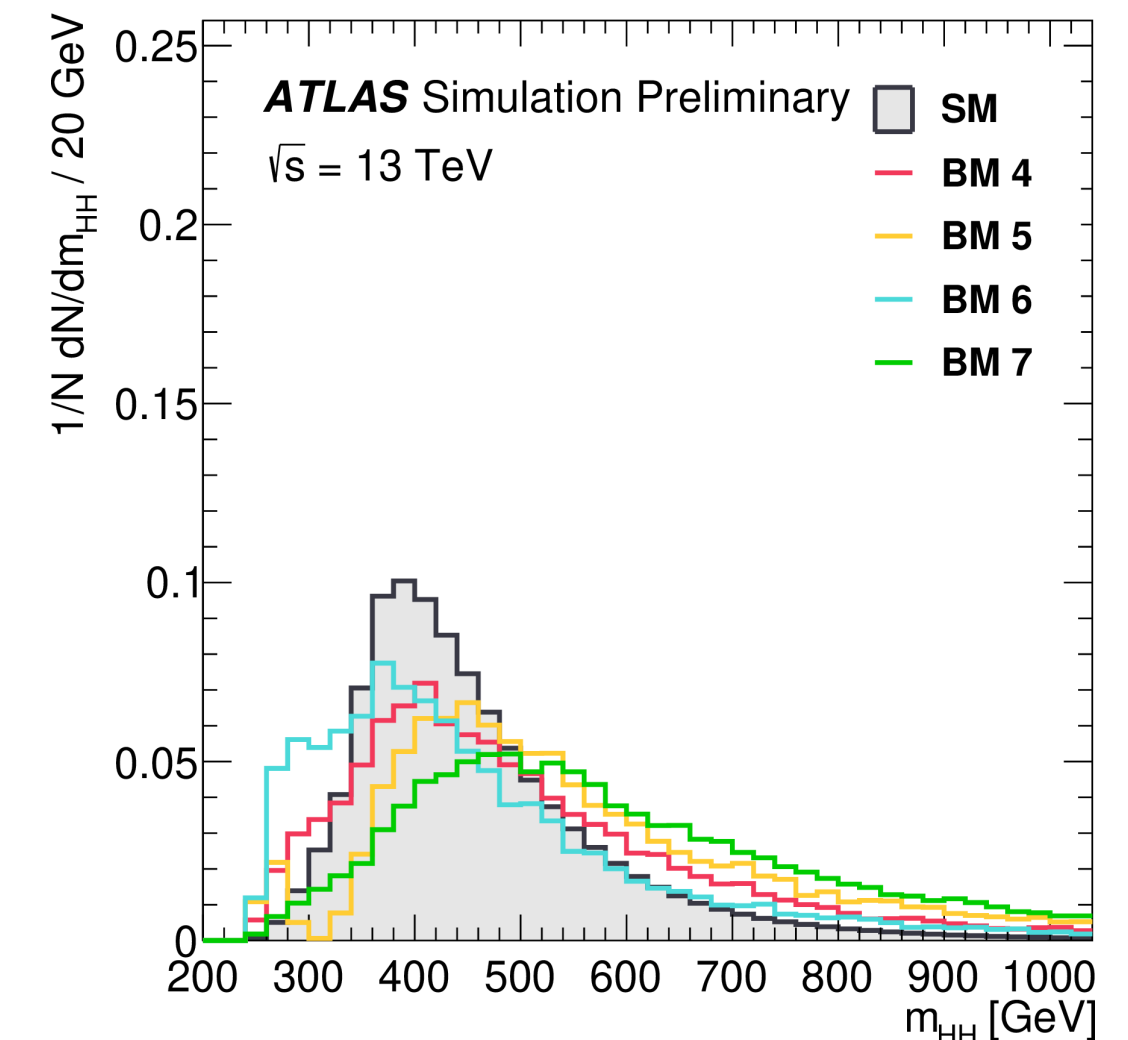

- interpretation of ggF  $HH \rightarrow bb\tau\tau$  ATLAS Run-2 search in **Higgs EFT framework**
- in the HEFT Lagrangian, ggF HH production is described at LO with 5 operators and their corresponding Wilson coefficients  $c$ :

- $c_{hhh}$ ,  $c_{tth}$ ,  $c_{ggh}$ ,  $c_{tthh}$ ,  $c_{gghh}$  where  $c_{hhh} = \kappa\lambda$  and  $c_{tth} = \kappa_t$
- smooth transition from kappa framework to EFTs (both contain  $\kappa\lambda$ )
- theorists have suggested a set of 7 benchmarks that fairly represent the different shapes obtained by the variations of  $c_{hhh}$ ,  $c_{tth}$ ,  $c_{ggh}$ ,  $c_{tthh}$ ,  $c_{gghh}$  in HEFT at NLO.

| Benchmark | $c_{hhh}$ | $c_{tth}$ | $c_{tthh}$ | $c_{ggh}$ | $c_{gghh}$ |
|-----------|-----------|-----------|------------|-----------|------------|

- signal significance above the background only hypothesis in the **baseline** scenario:
  - evidence** ( $> 3 \sigma$ ) for HH production if  $\kappa\lambda < 0.8$  or  $\kappa\lambda > 6.3$
  - observation** ( $> 5 \sigma$ ) for HH production if  $\kappa\lambda < -0.6$  or  $\kappa\lambda > 7.8$

# Summary

- Strong  $HH \rightarrow bb\tau\tau$  results with  $139 \text{ fb}^{-1}$  ATLAS data
  - **non-resonant**: obs (exp) 4.7 (3.9) x SM
  - **resonant**: obs (exp) 23 - 920 fb (12 - 840 fb) with excess @ 1 TeV with global significance of  **$2.0\sigma$**
  - obs (exp)  $\kappa_\lambda$  excluded outside the interval [-2.4, 9.2] ([-2.0, 9.0])
  - **HEFT benchmarks**: observed (expected) 95% CL intervals:
    - $-0.4 < c_{gg hh} < 0.4$  ( $-0.4 < c_{gg hh} < 0.4$ ) and  $-0.3 < c_{tt hh} < 0.7$  ( $-0.2 < c_{tt hh} < 0.6$ )
- **Factor 4 improvement** compared to  $36 \text{ fb}^{-1}$ 
  - 50% due to luminosity increase
  - 50% due to improved  $\tau_{\text{had}}$  and b-jet reconstruction and identification and analysis-level improvements
- $HH \rightarrow bb\tau\tau$  @ HL-LHC projection studies:
  - **HH signal significance** with (without) baseline systematic uncertainties:  **$2.8\sigma$  ( $4.0\sigma$ )**
  - **observation for HH production** with baseline systematic uncertainties if  $\kappa_\lambda < -0.6$  or  $\kappa_\lambda > 7.8$
