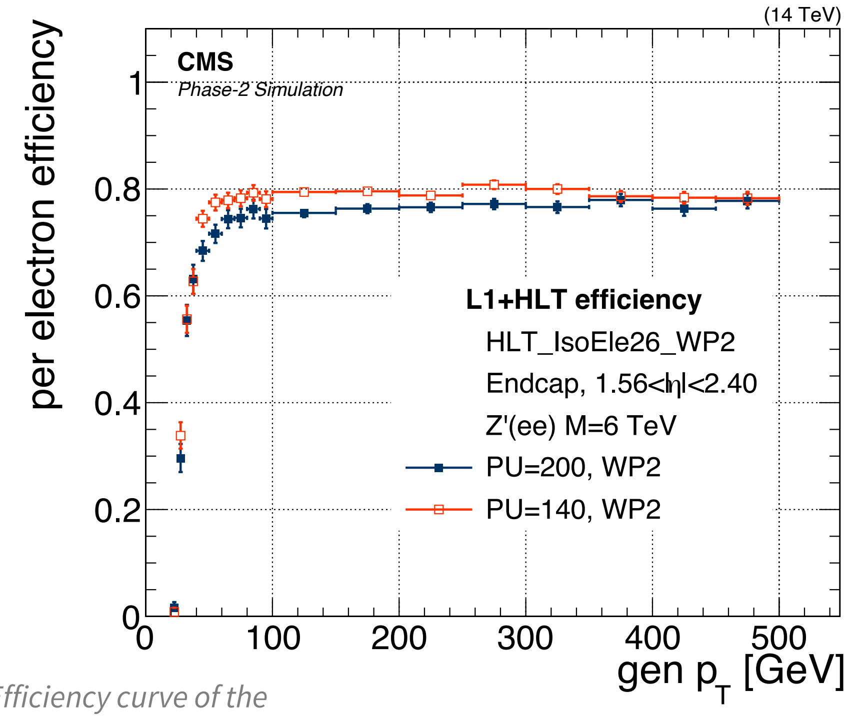
The Triple Challenge of the HLT



Efficiency curve of the single electron TDR trigger

Efficiency

- ❑ Select the events of interest
- ❑ Generalist vs. specialized triggers

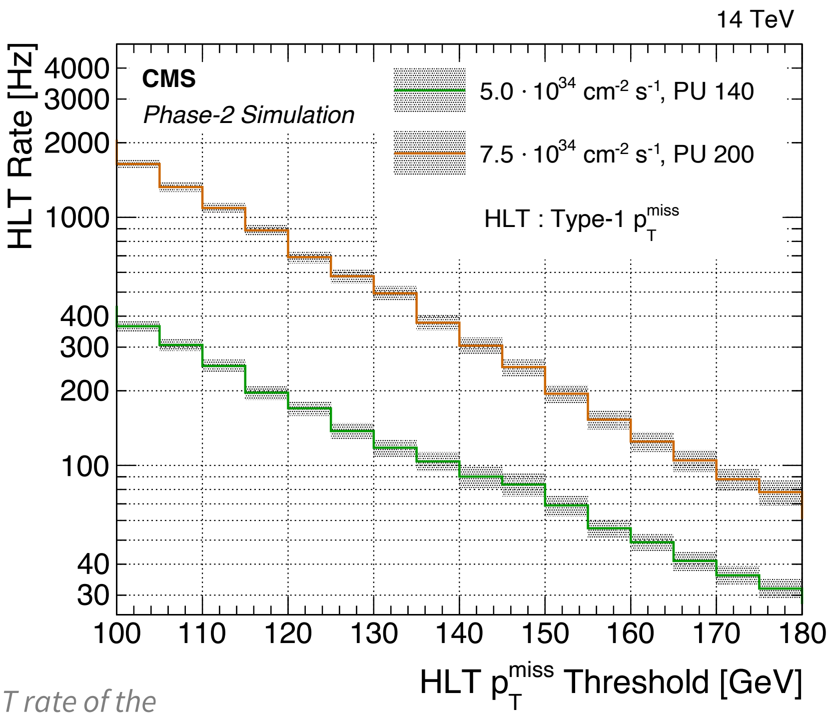
Rate

- ❑ Discard uninteresting events
- ❑ Output rate / bandwidth envelope

Timing

- ❑ Quasi-real time analysis
- ❑ Dependent on HLT farm size

The Triple Challenge of the HLT



HLT rate of the missing p_T TDR trigger

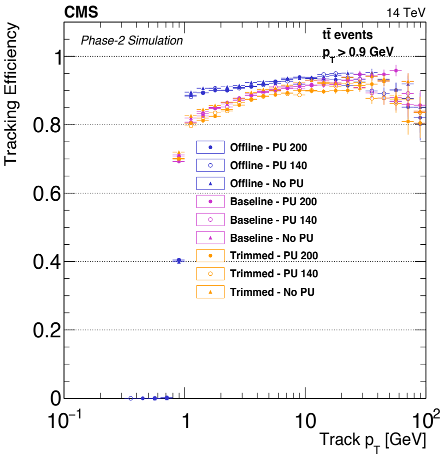
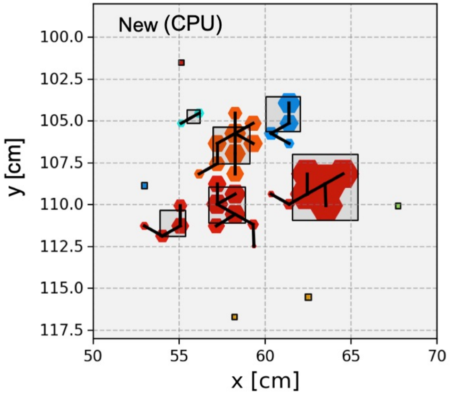
Online Reconstruction





Tracking, HGCAL

- Iterative, high-granularity detectors
- Tuned for online constraints

Electrons and photons

- (ECAL / HGCAL)-seeded objects
- Extensive ID to reduce backgrounds

Muons

- Seeded from L1TkMuon objects

Jets, missing p_T

- Extensive pileup mitigations

Tau leptons, b-tagged jets

- Machine learning techniques for ID

Simulated MC samples

- Minimum-bias (MB) sample: `SoftQCD` Pythia
  - Used for pileup events
  - Stand-in for lowest pthat QCD bin
- Multijet QCD
  - Disjoint pthat bins
  - Regular + lepton-enriched varieties
- W, Drell-Yan samples

Rate calculation

- Efficiency over each sample
- Function of p_T or ID threshold
- Individual for each path

Stitching

- Correct “pileup events harder than main interaction”

Simplified Menu: Timing

Reference hardware

- 2x AMD EPYC 7502 processors,
  64 (128) physical (logical) cores
- 1679 +- 2 HS06 computing power
- HLT processing power
  ~ follows HS06 number

Modus operandi

- Integrated HLT menu
  - Exception: tau reconstruction
- 32 independent HLT jobs
- 4 threads per job

Samples

- L1-skimmed MB
  - Realistic approximation of HLT input
- Inclusive ttbar production
  - Hypothetical case: almost all events accepted

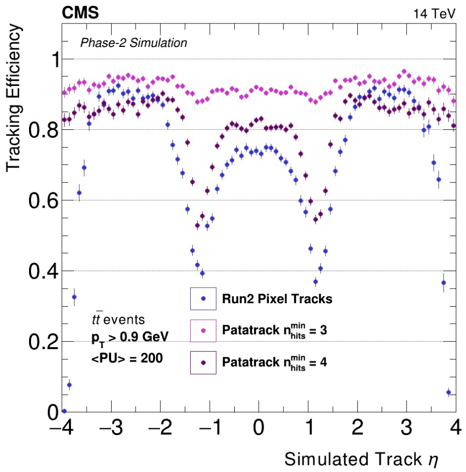
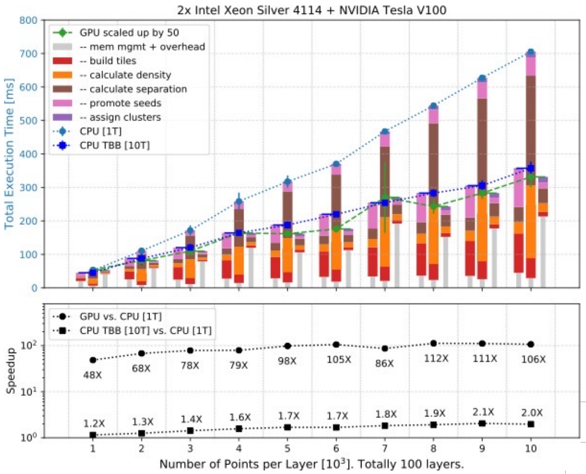
Heterogeneous Computing

Ubiquitous solution for CMS computing needs by 2027

- Heterogeneous HLT farm already starting from Run-3.





Phase-2 heterogeneous HLT

- Under development: HGCAL local reconstruction, Patatrack pixel reconstruction.

Effective farm cost

- 0.70 CHF/HS06 in 2028 – 50% code ported
- 0.22 CHF/HS06 in 2032 – 80% code ported

Conclusions

Reconstruction advanced enough to build a simplified menu for the TDR.

- Fully realistic (no simulation shortcuts) and integrated in CMSSW.
- Basic single-object paths with performance very close to Phase-1.
- Solid foundation to evolve into real menu to be deployed in Phase-2.

Rates and timing under control.

- Simplified menu keeps to 50% of the target Phase-2 rate.
- Large p_T threshold increases are not needed.
- Timing structure of the menu understood.
  - In order to meet the overall constraints for the HLT farm, we need to improve the overall timing by a small factor (1.5-2x).

Heterogeneous HLT under development.

- Initial deployment already in Run3.
