# Beyond the Standard Model Searches at Colliders

Katharine Leney

Southern Methodist University, Dallas, Texas, US

24th May 2022

# Outline

## Today: Why and how we look for BSM physics

- Why are we looking beyond the Standard Model?
- How do we search for new physics?
- Anomaly-driven searches.

# Outline

## Today: Why and how we look for BSM physics

- Why are we looking beyond the Standard Model?
- How do we search for new physics?
- Anomaly-driven searches.

### Disclaimer

BSM searches at colliders covers a vast amount of experimental and theoretical work - not possible to cover everything in two 40 minute talks!

There is also a lot of personal bias in this talk! Due to the limited time I have chosen to focus more on areas I personally find interesting (and/or have expertise in).

# Outline

## Today: Why and how we look for BSM physics

- Why are we looking beyond the Standard Model?
- How do we search for new physics?
- Anomaly-driven searches.

## Tomorrow: New physics in the scalar sector

- Additional Higgs bosons.
- Using the Standard Model Higgs boson as a tool to search for new physics.
  - Exotic decays of the Higgs boson
  - Higgs self-coupling as a probe of new physics.

### Disclaimer

BSM searches at colliders covers a vast amount of experimental and theoretical work - not possible to cover everything in two 40 minute talks!

There is also a lot of personal bias in this talk! Due to the limited time I have chosen to focus more on areas I personally find interesting (and/or have expertise in).

# The Standard Model

# The Standard Model

**Fermions**  
3 generations of  
**quarks** and **leptons**  
- spin  $\frac{1}{2}$  particles

# The Standard Model

KALUZA-KLEIN  
GRAVITONS

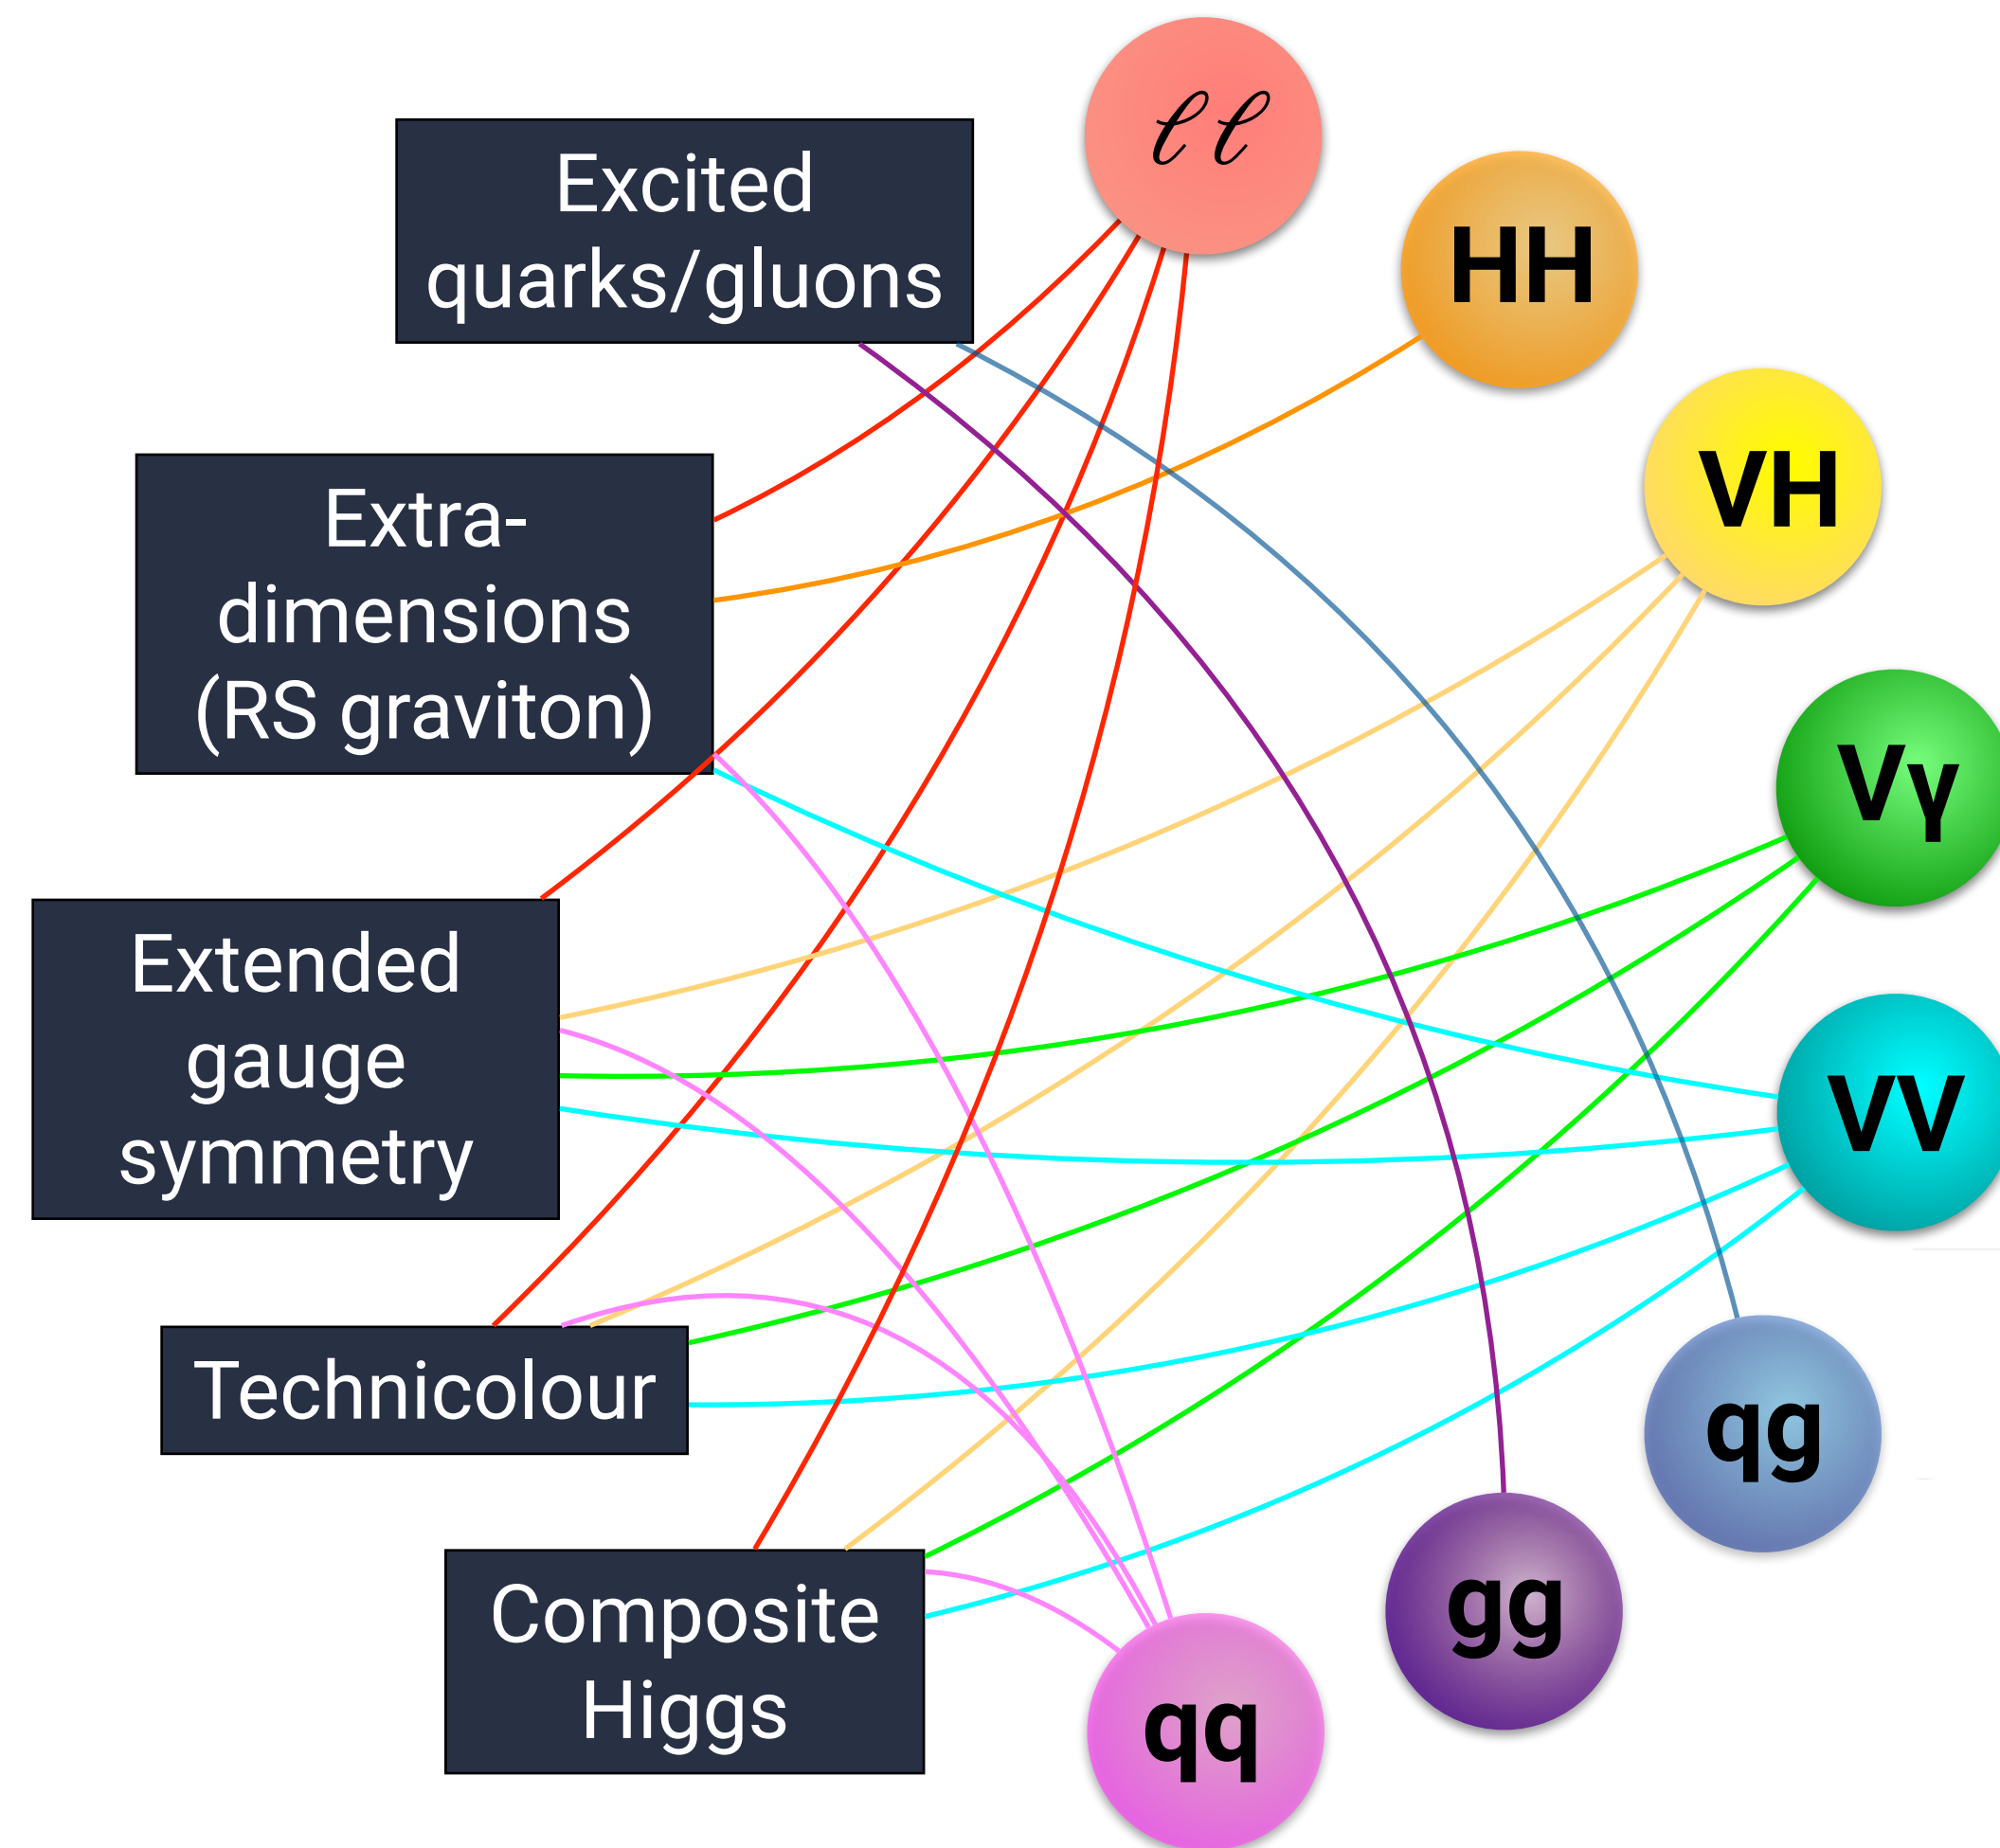

Models for new physics try to explain these phenomena by introducing new particles or interactions → search for evidence of these at colliders

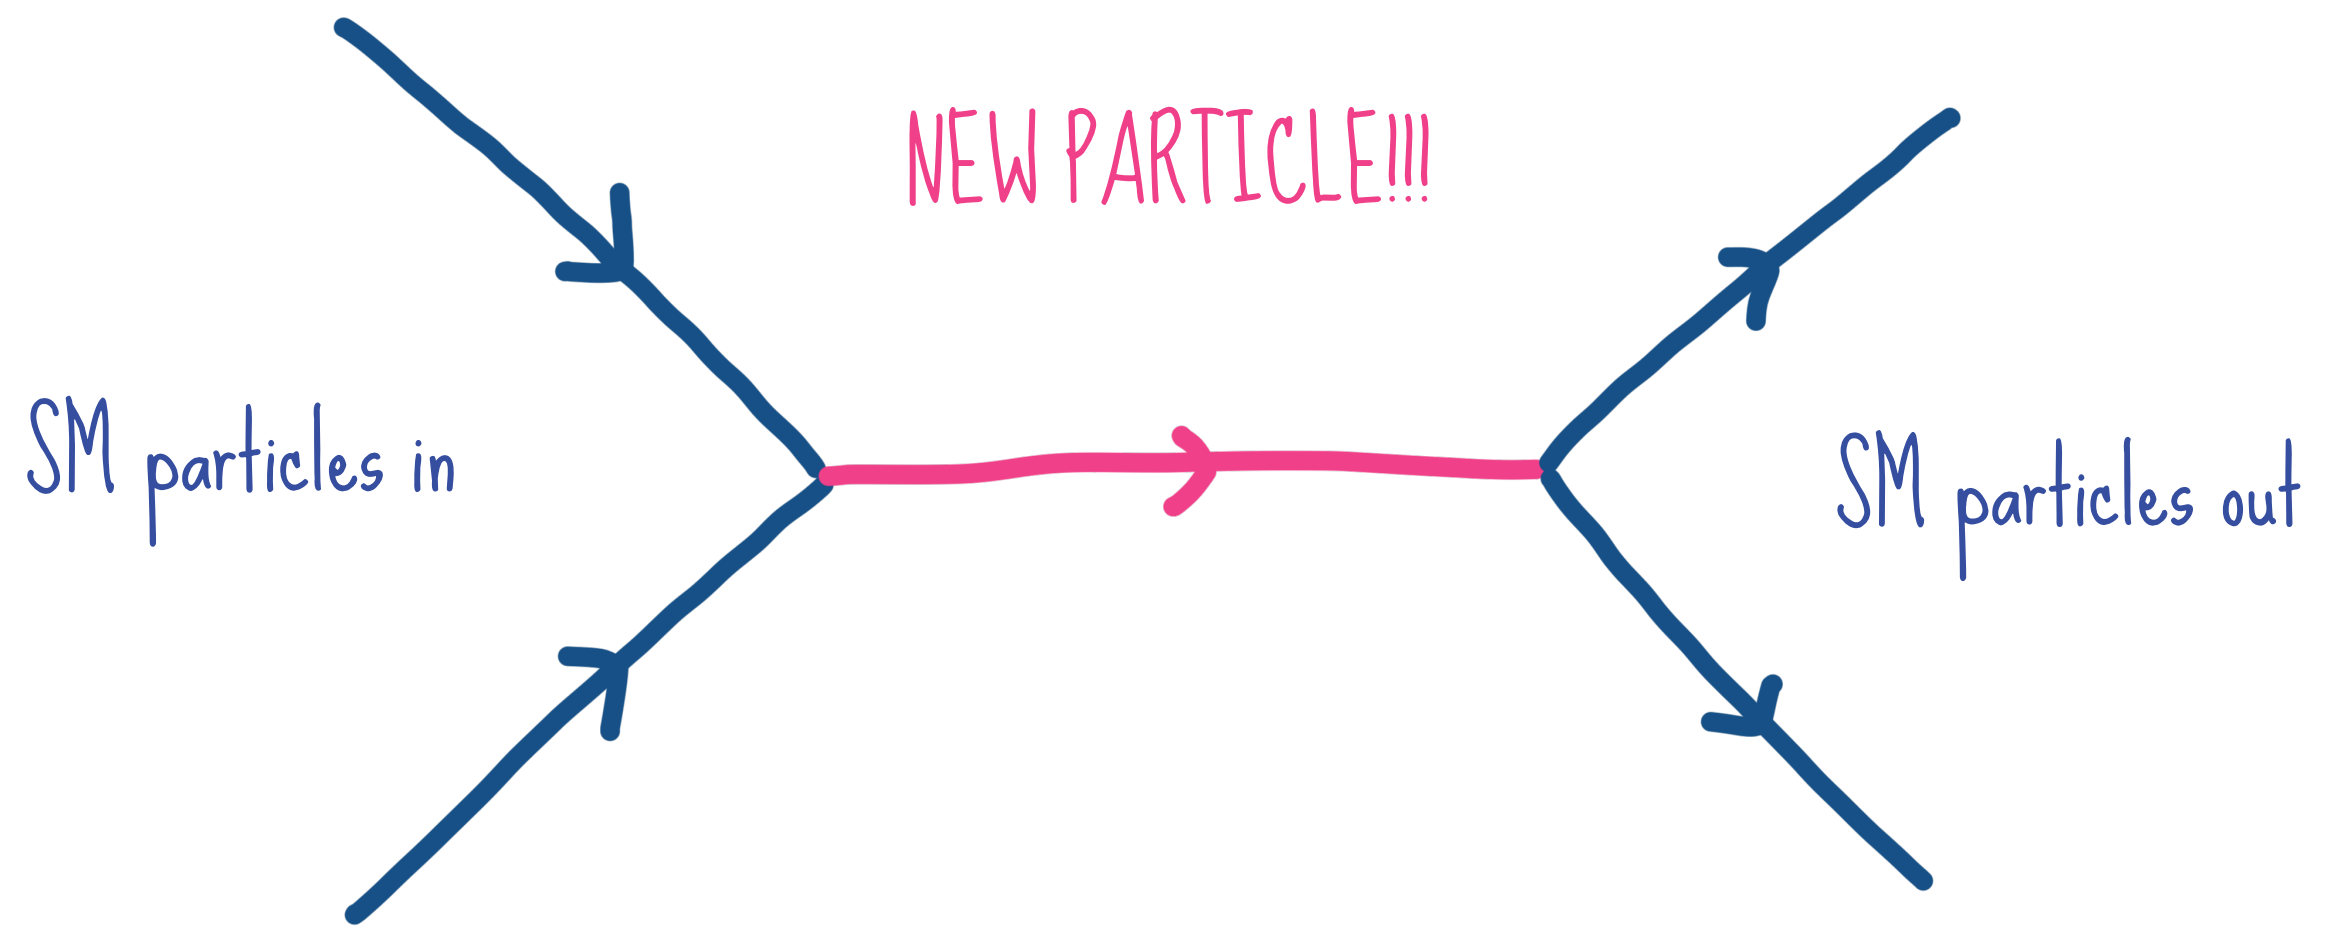

# Resonance searches

Many BSM theories predict narrow resonances at the TeV mass scale.

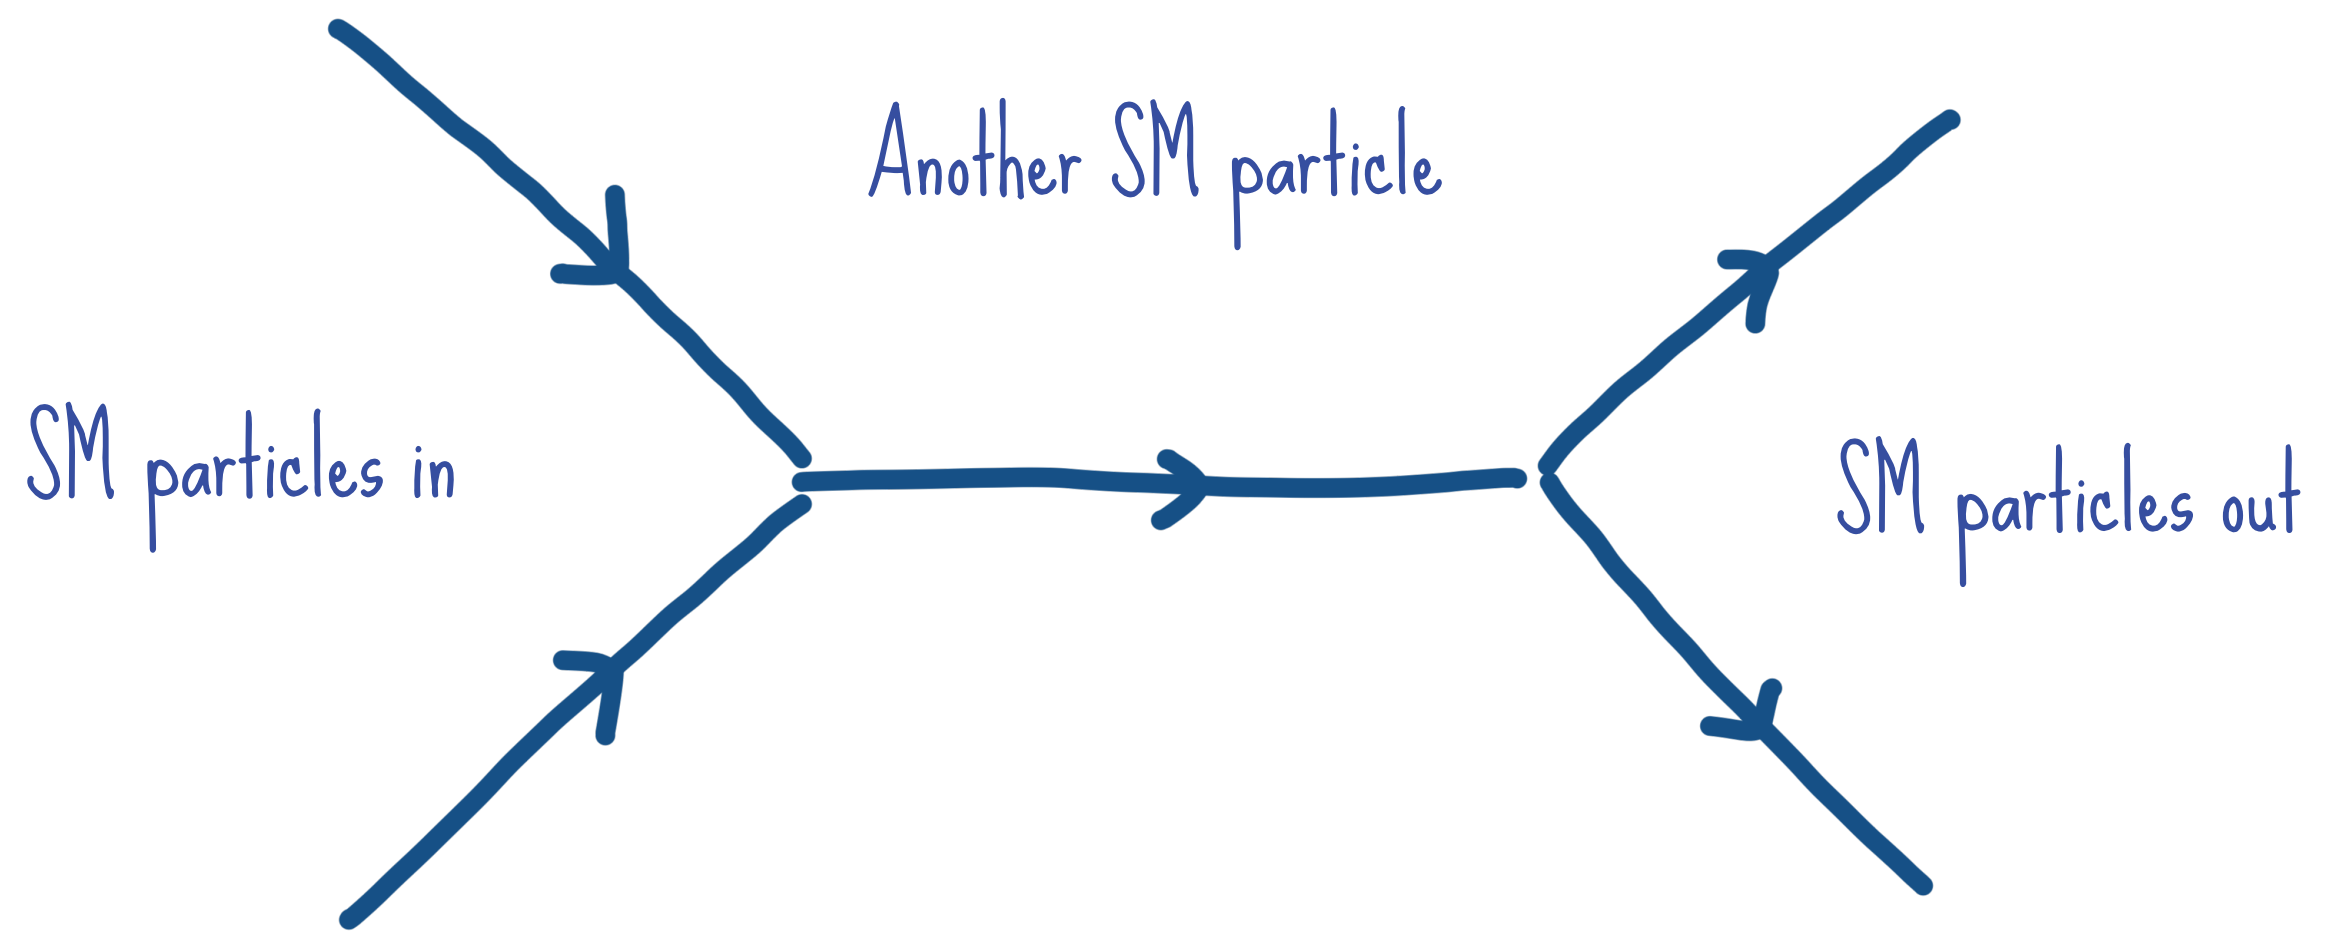

- Clear 'bump' over SM background.
- Almost any combination of 2 SM particles can form a resonance in BSM models.

# Resonance search - simple example

# Resonance search - simple example

# Resonance search - simple example

# Resonance search - simple example

# Steps in a BSM search analysis

# Steps in a BSM search analysis

1. Choose a topic.
  - i. Usually theory-motivated (see next slides!).
  - ii. Sometimes do “generic” searches that look for deviations from SM predictions in a given final state.

# Steps in a BSM search analysis

1. Choose a topic.
  - i. Usually theory-motivated (see next slides!).
  - ii. Sometimes do “generic” searches that look for deviations from SM predictions in a given final state.
2. Decide which production/decay mode(s) you’ll look at.
  - i. Usually some trade off between cross-section/branching ratio, how “clean” the final state is (i.e. can you reject a lot of background).

THE  
S

♪ THE SIMPSONS ♪

# Case study

In season 21, episode 16 of The Simpsons, Homer has decided to do a PhD in particle physics on the ATLAS experiment at CERN. He needs to pick a thesis topic.

The LHC has just started taking data, and everyone's excited about finding a new particle called the Higgs boson.

*That sounds like fun!  
But the Higgs boson  
can be produced and  
decay in so many  
different ways... which  
channel should I  
choose?*

# Choose a channel

Choose production and decay modes that maximise the number of Higgs bosons?

→ Gluon-fusion production, decay to b-quarks (Homer has a hunch that the Higgs will be light ;-)).

# ggH → bb?

D'OH!

- ✗ b-jets are probably the most difficult objects to identify in the detector.
- ✗ Gluon-fusion doesn't really provide any distinctive signature.
- ✗ Jet backgrounds are many orders of magnitude larger than your  $H \rightarrow bb$  signal.
- ✗ Poor mass resolution of the bb pair.

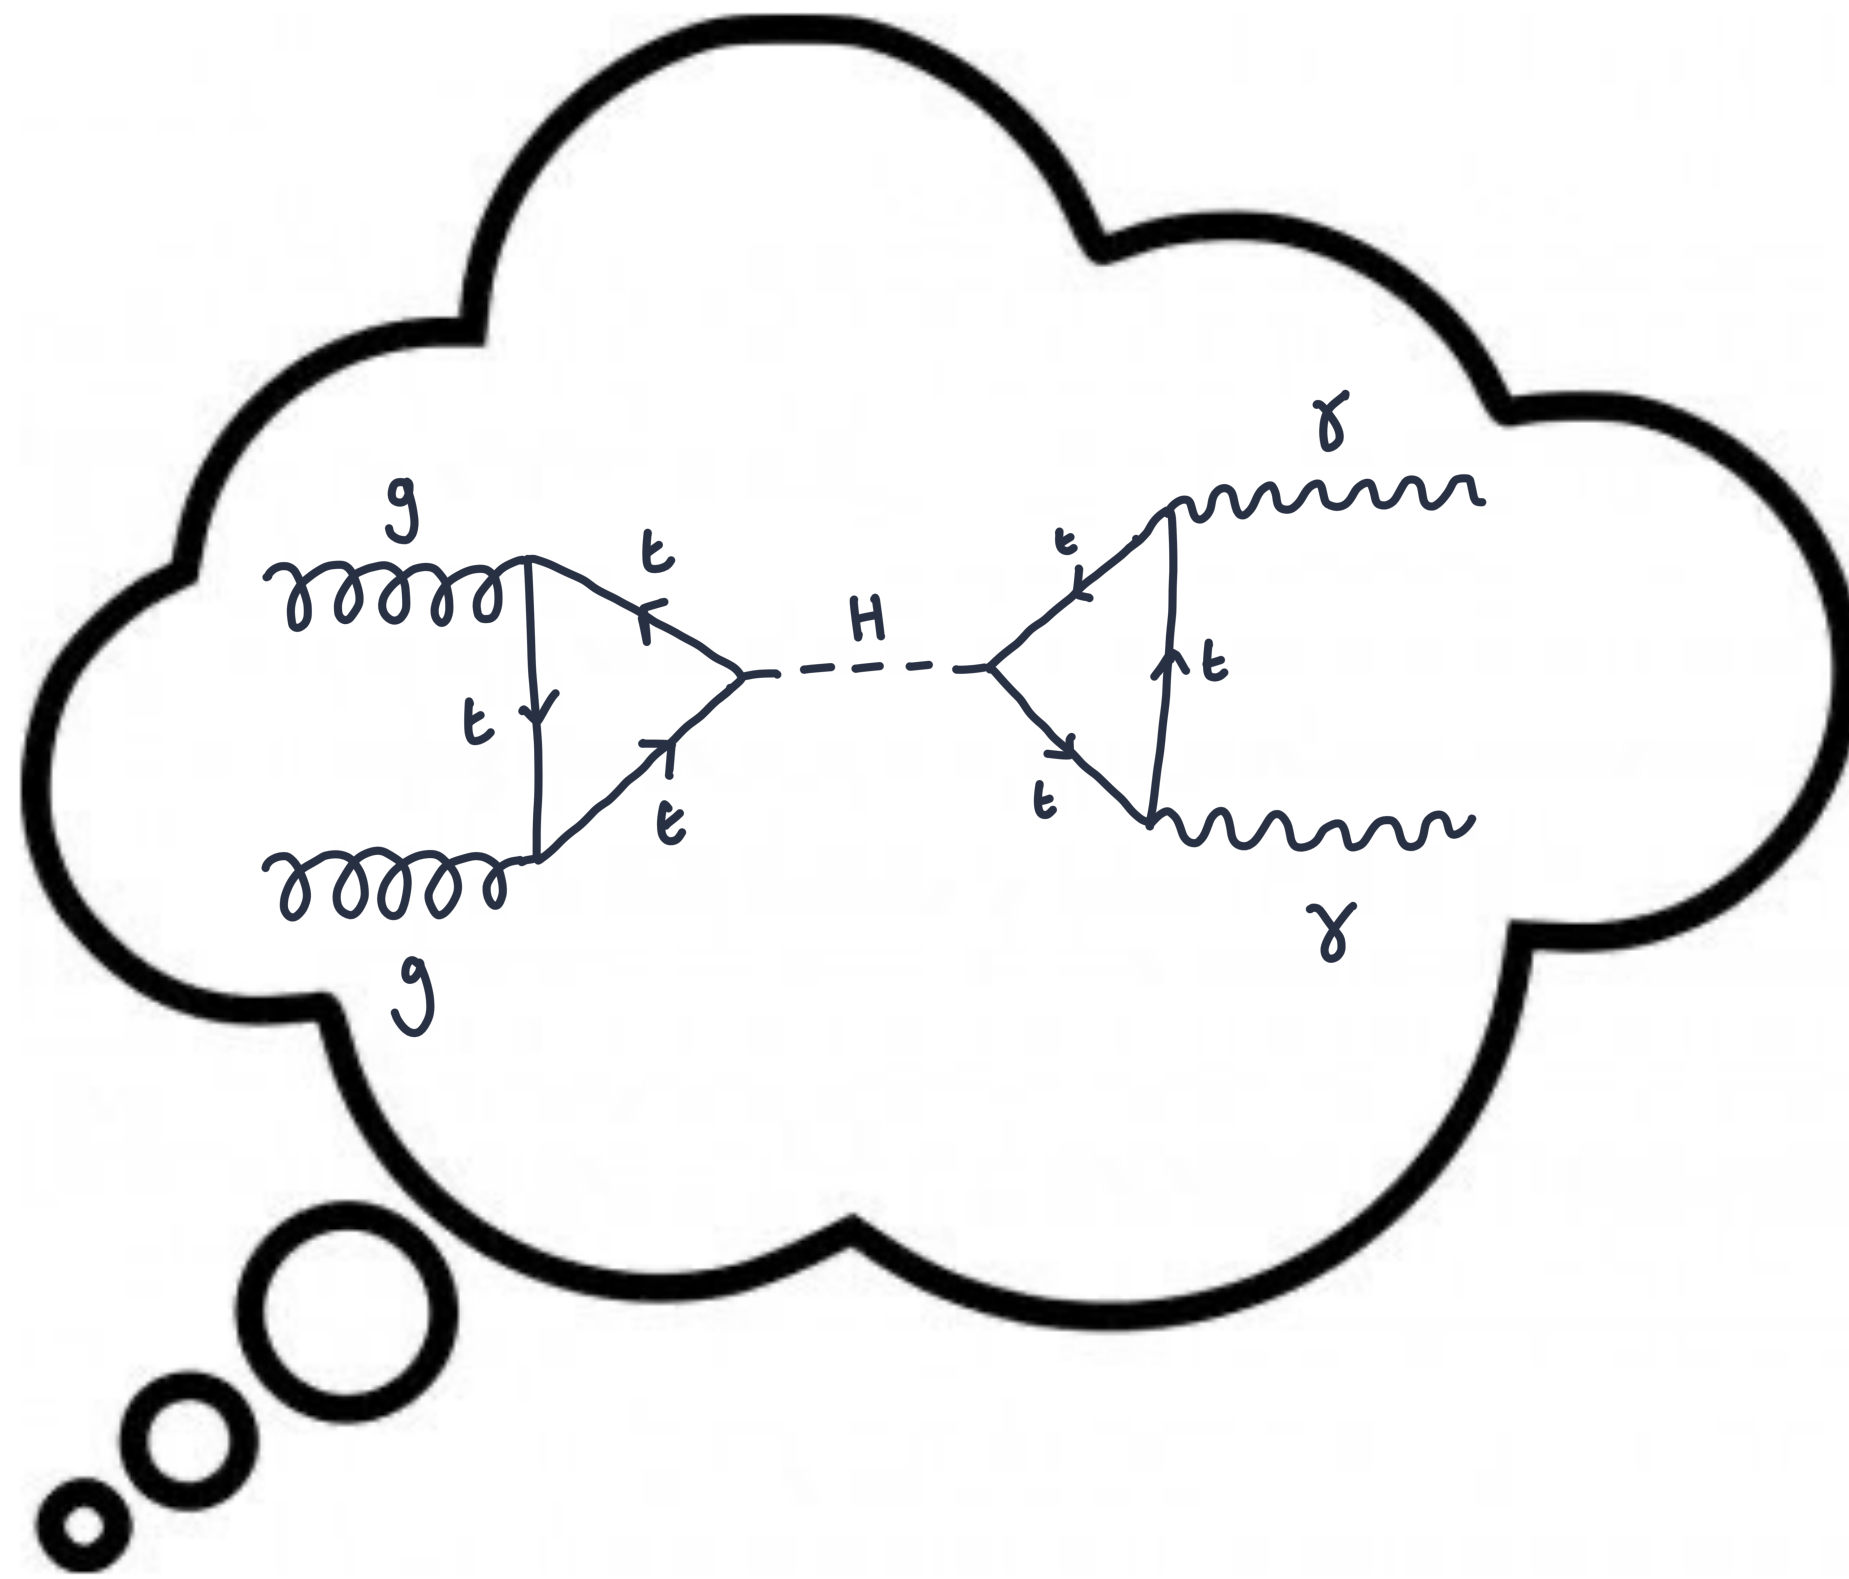

# Choose a channel

Need more “distinctive” signature...

→ Gluon-fusion production to keep large cross-section, but decay to photons.

$ggH \rightarrow \gamma\gamma$ ?

- ✓ Photons are “easy” to identify in the detector.
- ✓ Small backgrounds.
- ✓ Excellent mass resolution.

# ggH → $\gamma\gamma$ : a winning combination!

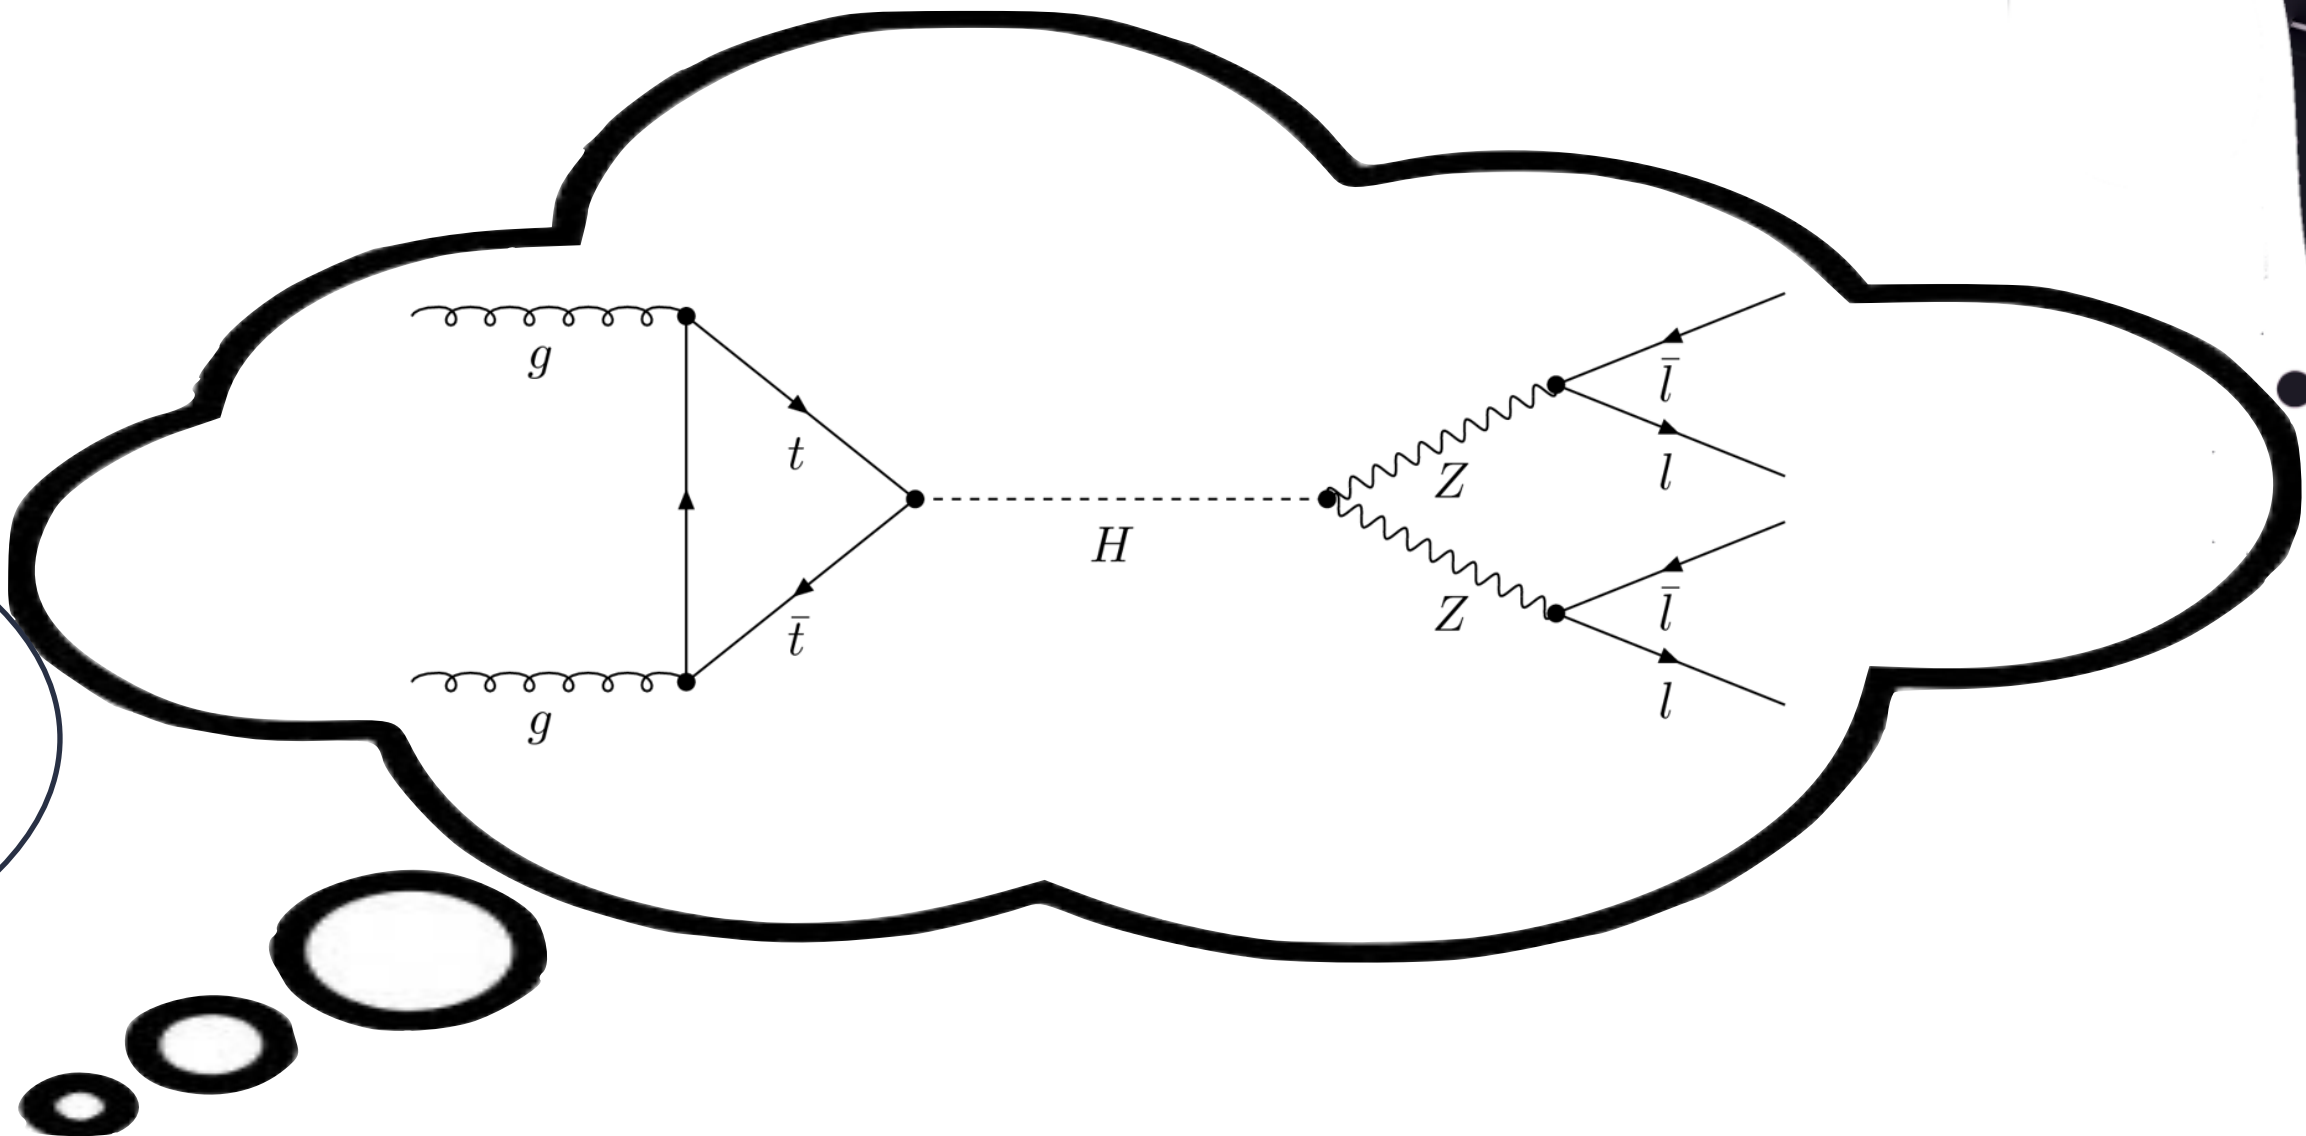

# Dr Homer Simpson

# H → ZZ?

What about  
 $H \rightarrow ZZ \rightarrow 4e/e\mu\mu/4\mu$ ?

- ✓ Moderate branching ratio to ZZ.
- ✓ Z bosons can decay to electrons and muons that are easy to identify.
- ✓ Small backgrounds.
- ✓ Good mass resolution.
- ✗  $BR(Z \rightarrow ee/\mu\mu) = 3.3\% \rightarrow BR(ZZ \rightarrow 4e/e\mu\mu/4\mu) = 0.5\%$

# H → ZZ : another winner!

# But... what about $H \rightarrow bb$ ?

- Search for events where the Higgs is produced in association with a leptonically decaying W or Z boson to get an extra handle to reject backgrounds.
- Use BDTs to improve signal-background separation. (See T. Golling's lectures for more on machine learning.)

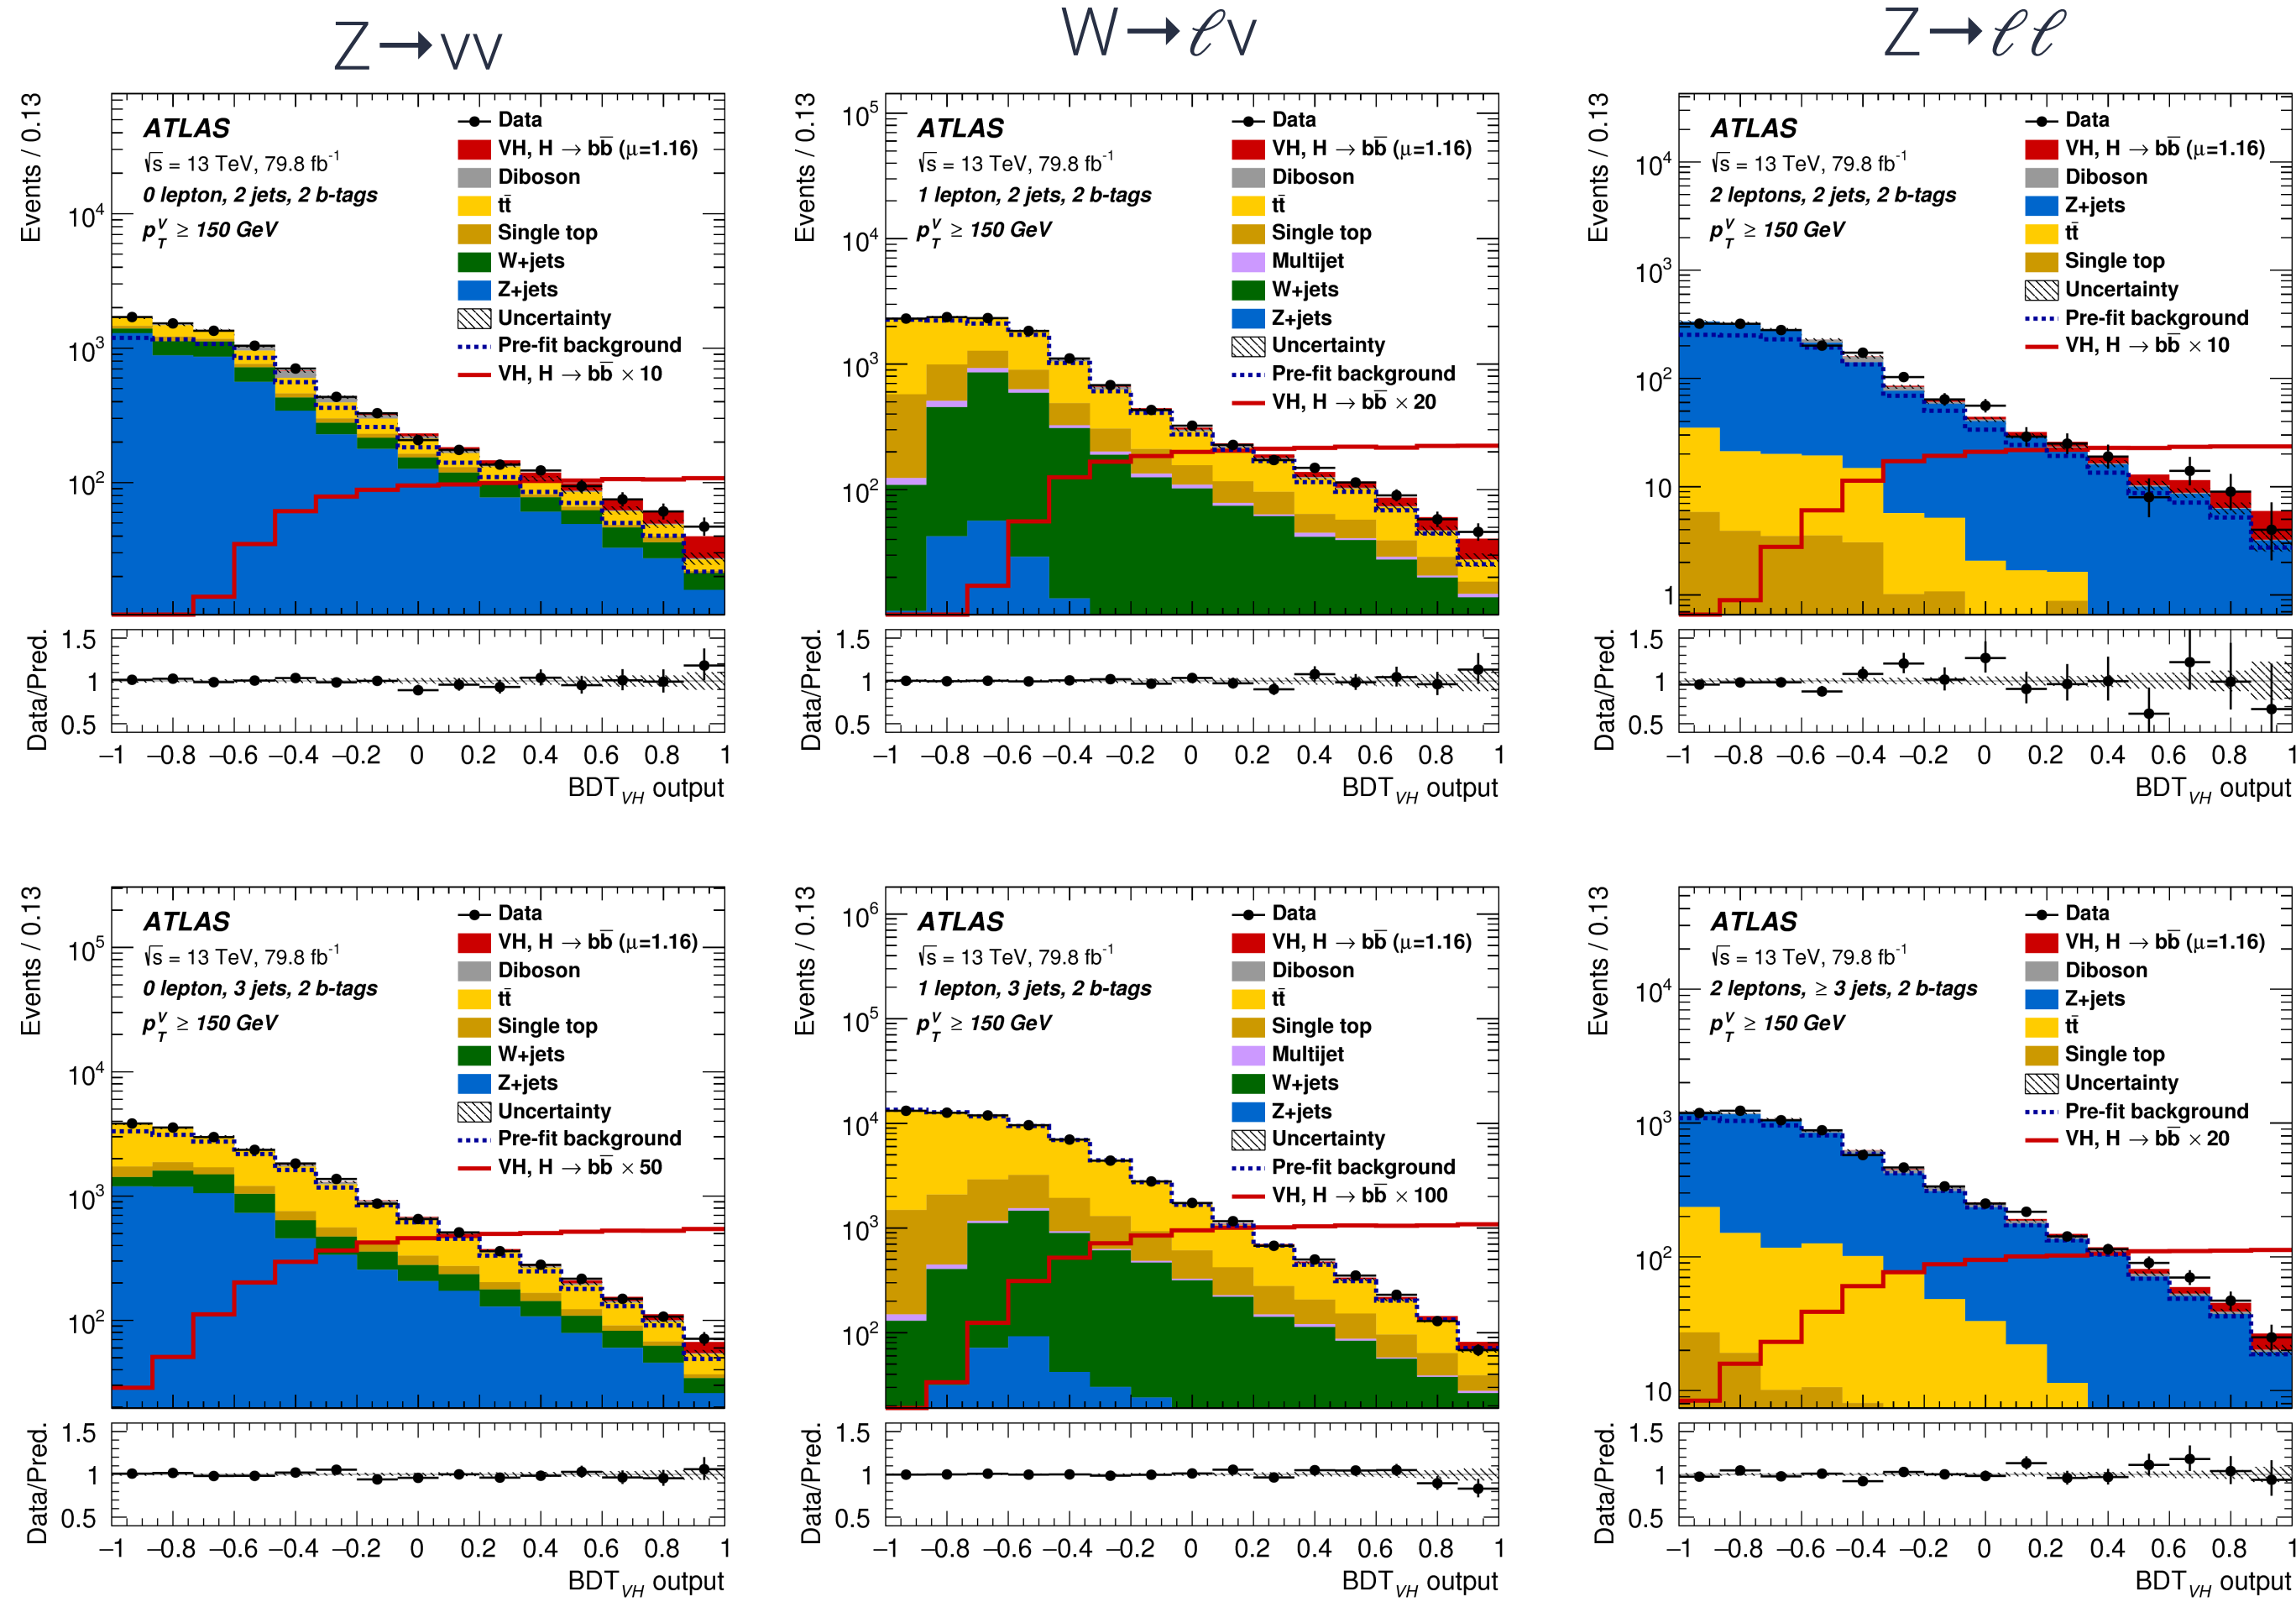

ggF  
 $H \rightarrow bb$

VH ( $H \rightarrow bb$ )  
with machine  
learning

# H → bb

Eur. Phys. J. C 81 (2021) 178

Events / 10 GeV (Weighted, backgr. sub.)

6 years after the Higgs discovery ( $\gamma\gamma + ZZ$  channels), BDTs in 6 different signal regions, 3 x more data,  $\sqrt{s}$  increase from 7/8 TeV → 13 TeV.

# Was it worth it?!

Yes!

During the Higgs “search phase”:

- We didn't know its mass...
- ...or if it would be SM-like...
- ...or if it would even be there at all!

# Was it worth it?!

Yes!

During the Higgs “search phase”:

- We didn't know its mass...
- ...or if it would be SM-like...
- ...or if it would even be there at all!

And later:

- Crucial to establish that the Higgs does decay to b-quarks (as predicted by the SM).
- Test mass hierarchy of Higgs couplings.

# Steps in a BSM search analysis

1. Choose a topic.
  - i. Usually theory-motivated (see next slides!).
  - ii. Sometimes do “generic” searches that look for deviations from SM predictions in a given final state.
2. Decide which production/decay mode(s) you’ll look at.
  - i. Usually some trade off between cross-section/branching ratio, how “clean” the final state is (i.e. can you reject a lot of background).
3. What is the final state? Implement “Preselection” cuts.
  - i. Typically demand that the events contain the same objects as you would expect in your signal that you can then use as a starting point for defining regions which are enriched in signal, and others that are enriched in backgrounds.
  - ii. Ensure the selection is loose enough that you can estimate background processes, but tight enough that your data volume is manageable.

  - ii. Ensure the selection is loose enough that you can estimate background processes, but tight enough that your data volume is manageable.
4. Determine preselected sample’s composition using MC and data to understand contributions.
  - i. Multijet background almost always extracted from data.
  - ii. Also need to correct MC for real-life data conditions.

# Steps in a BSM search analysis

1. Choose a topic.

4. Determine preselected sample’s composition using MC and data to understand contributions.
  - i. Multijet background almost always extracted from data.
  - ii. Also need to correct MC for real-life data conditions.
5. As statistics increase, more difficult, since mis-modelings not hidden by statistical uncertainties anymore
  - i. Mis-modelings often show up in tails...

# So what BSM physics should I look for?

- Saw before that there are many phenomena still not understood - most searches are motivated by trying to address one (or more) of these problems.
- Additionally, precision measurements of SM processes often provide key insight into where new physics might be hiding.
  - Helps guide where to focus efforts for new physics searches.

CAUTION: Anomalies in measurements are not proof of new physics! But... they can provide useful clues about where to look.

# Case study: lepton flavour universality

# Lepton universality

- Standard Model predicts lepton universality, i.e. the coupling of leptons to all types of gauge boson are flavour-independent.
- Some experimental hints that this might not be the case.

# Muon g-2

Measurement of muon anomalous magnetic moment in  $4.2\sigma$  tension with SM prediction...

# Muon g-2

... but newer theory prediction that uses a different approach is only  $1.5\sigma$  away from measurement.

# Muon g-2

... but newer theory prediction that uses a different approach is only  $1.5\sigma$  away from experimental average.

Too early to get excited, but intriguing when considered in context with the other flavour anomalies...

Interesting to see how this will develop in the coming years, with more data/improved experimental methods.

# Flavour anomalies

- Small-to-moderate deviations from SM predictions in many measurements probing lepton universality.
- e.g.  $R(K), R(K^*)$  combination deviates from SM by  $\sim 2-2.5\sigma$ .

$$R(K^{(*)}) = \frac{BR(B \rightarrow K^{(*)} \mu^+ \mu^-)}{BR(B \rightarrow K^{(*)} e^+ e^-)}$$

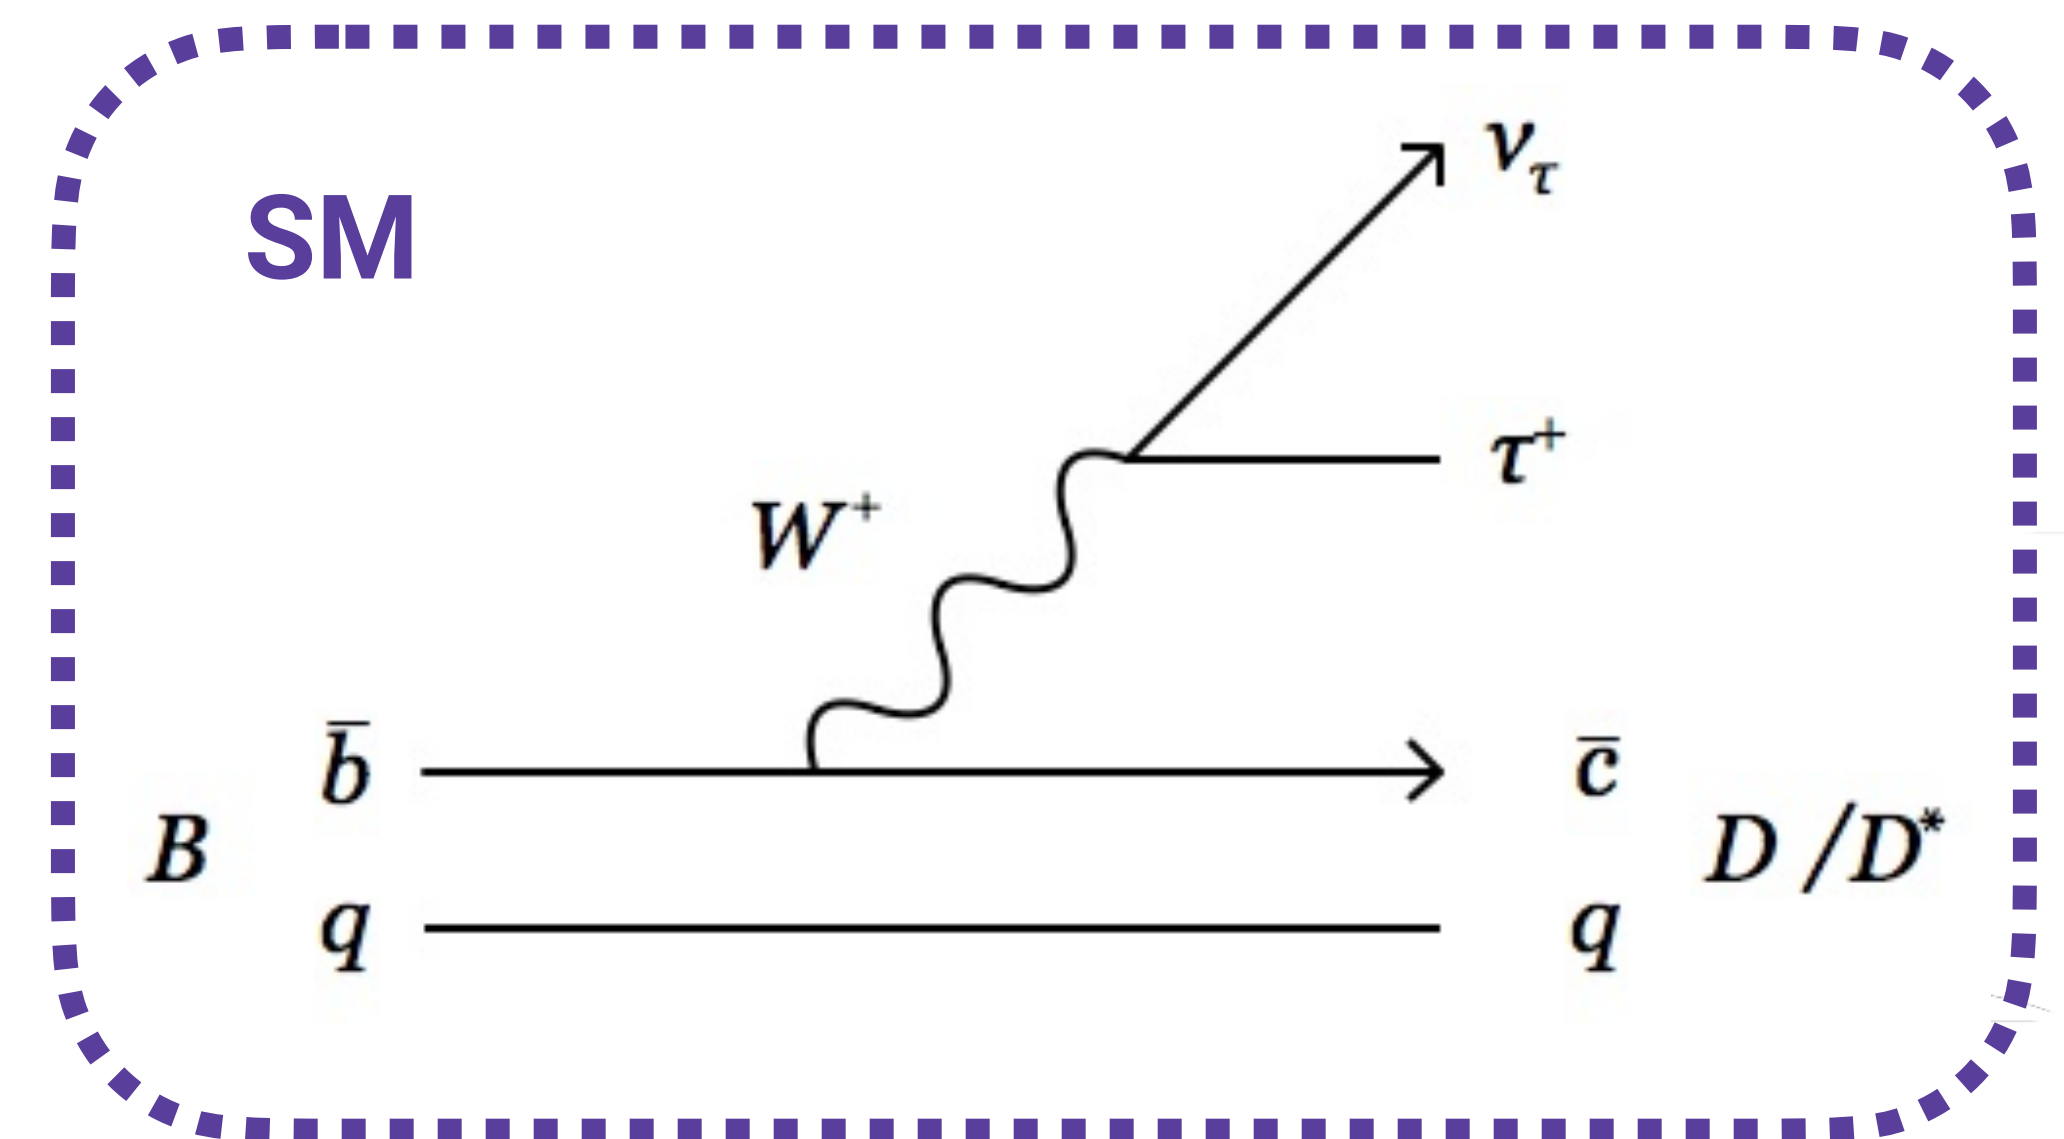

# Flavour anomalies

- $R(D), R(D^*)$  combination deviates from SM by  $\sim 4\sigma$ .

$$R(D^{(*)}) = \frac{BR(B \rightarrow D^{(*)}\tau\nu)}{BR(B \rightarrow D^{(*)}\mu\nu)}$$

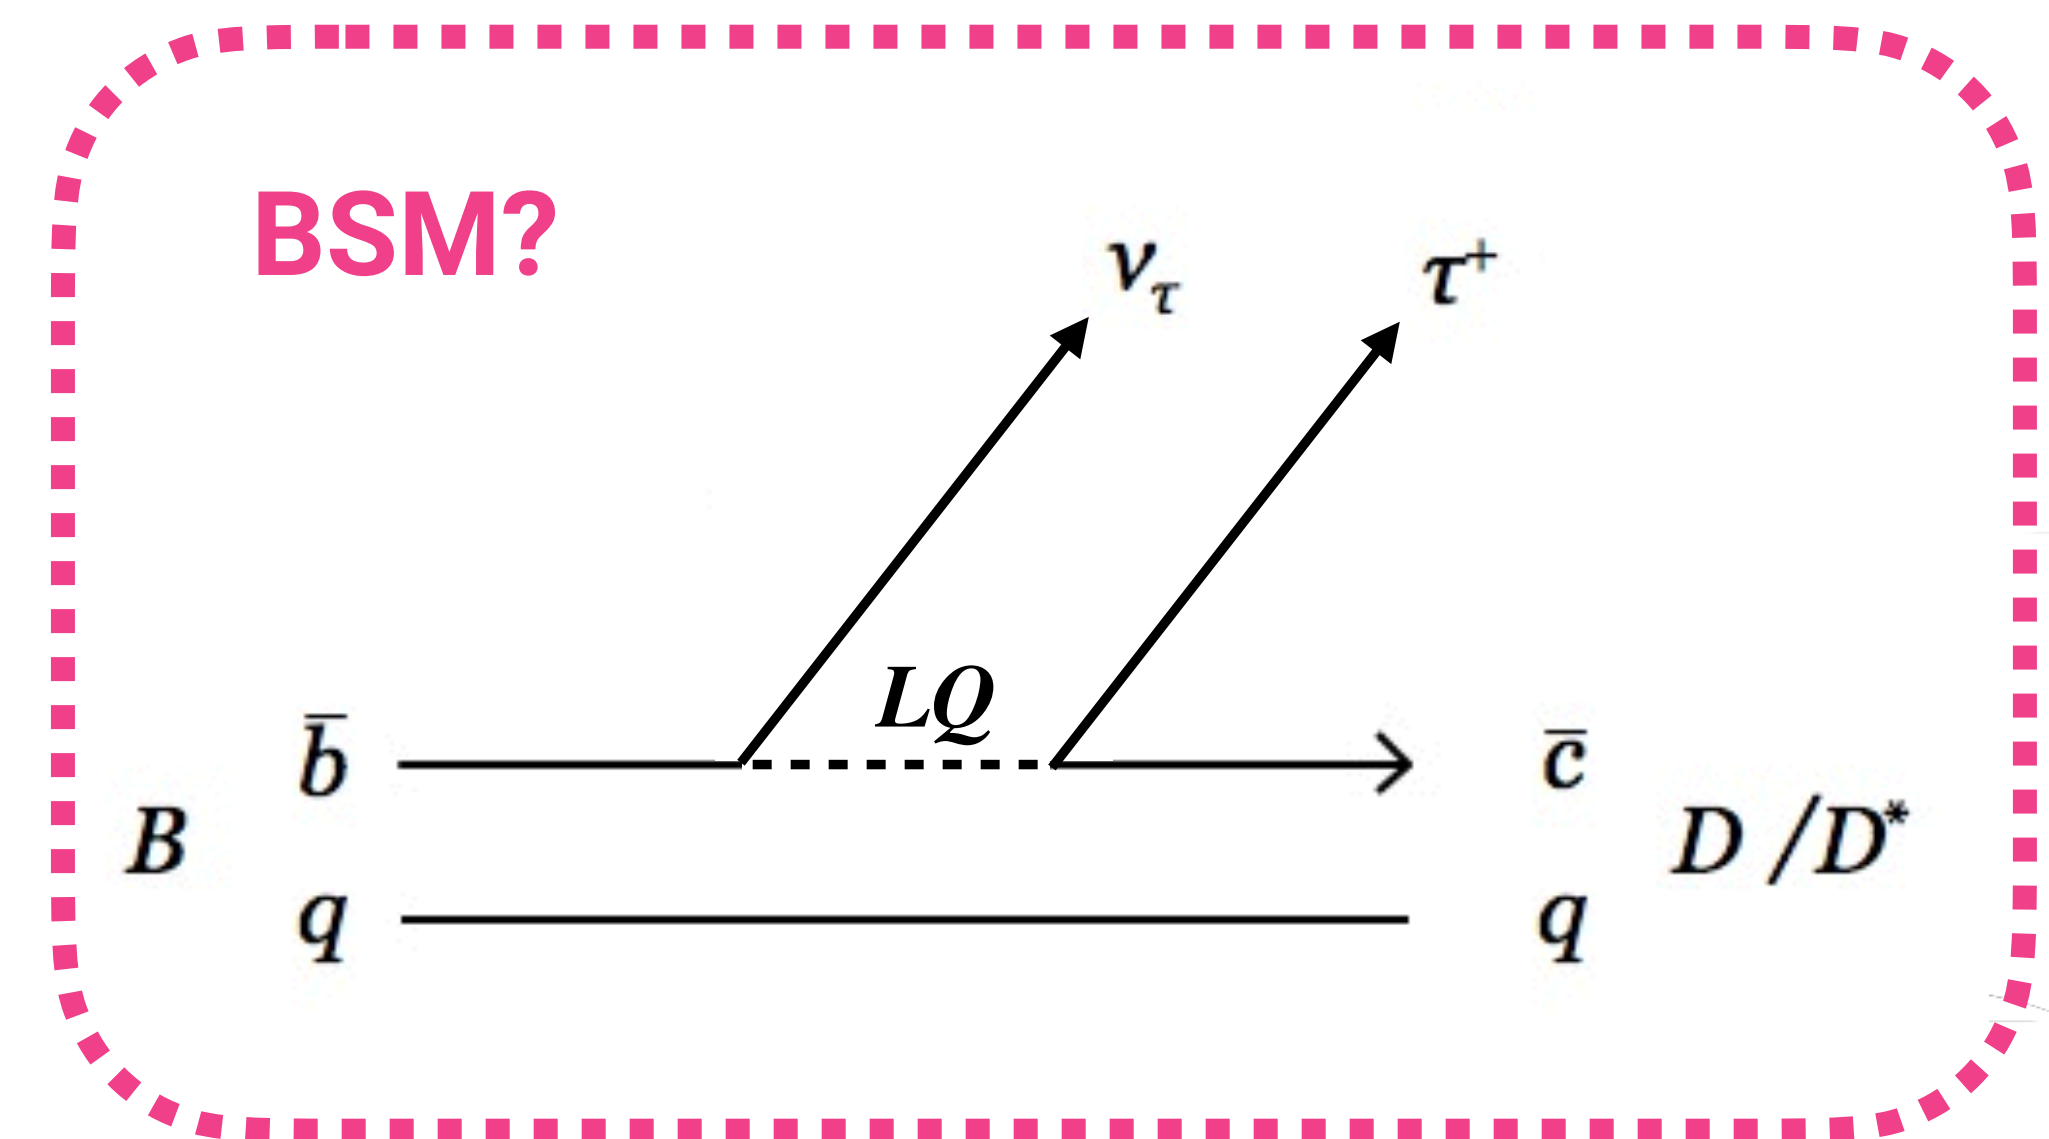

# Flavour anomalies

- $R(D), R(D^*)$  combination deviates from SM by  $\sim 4\sigma$ .

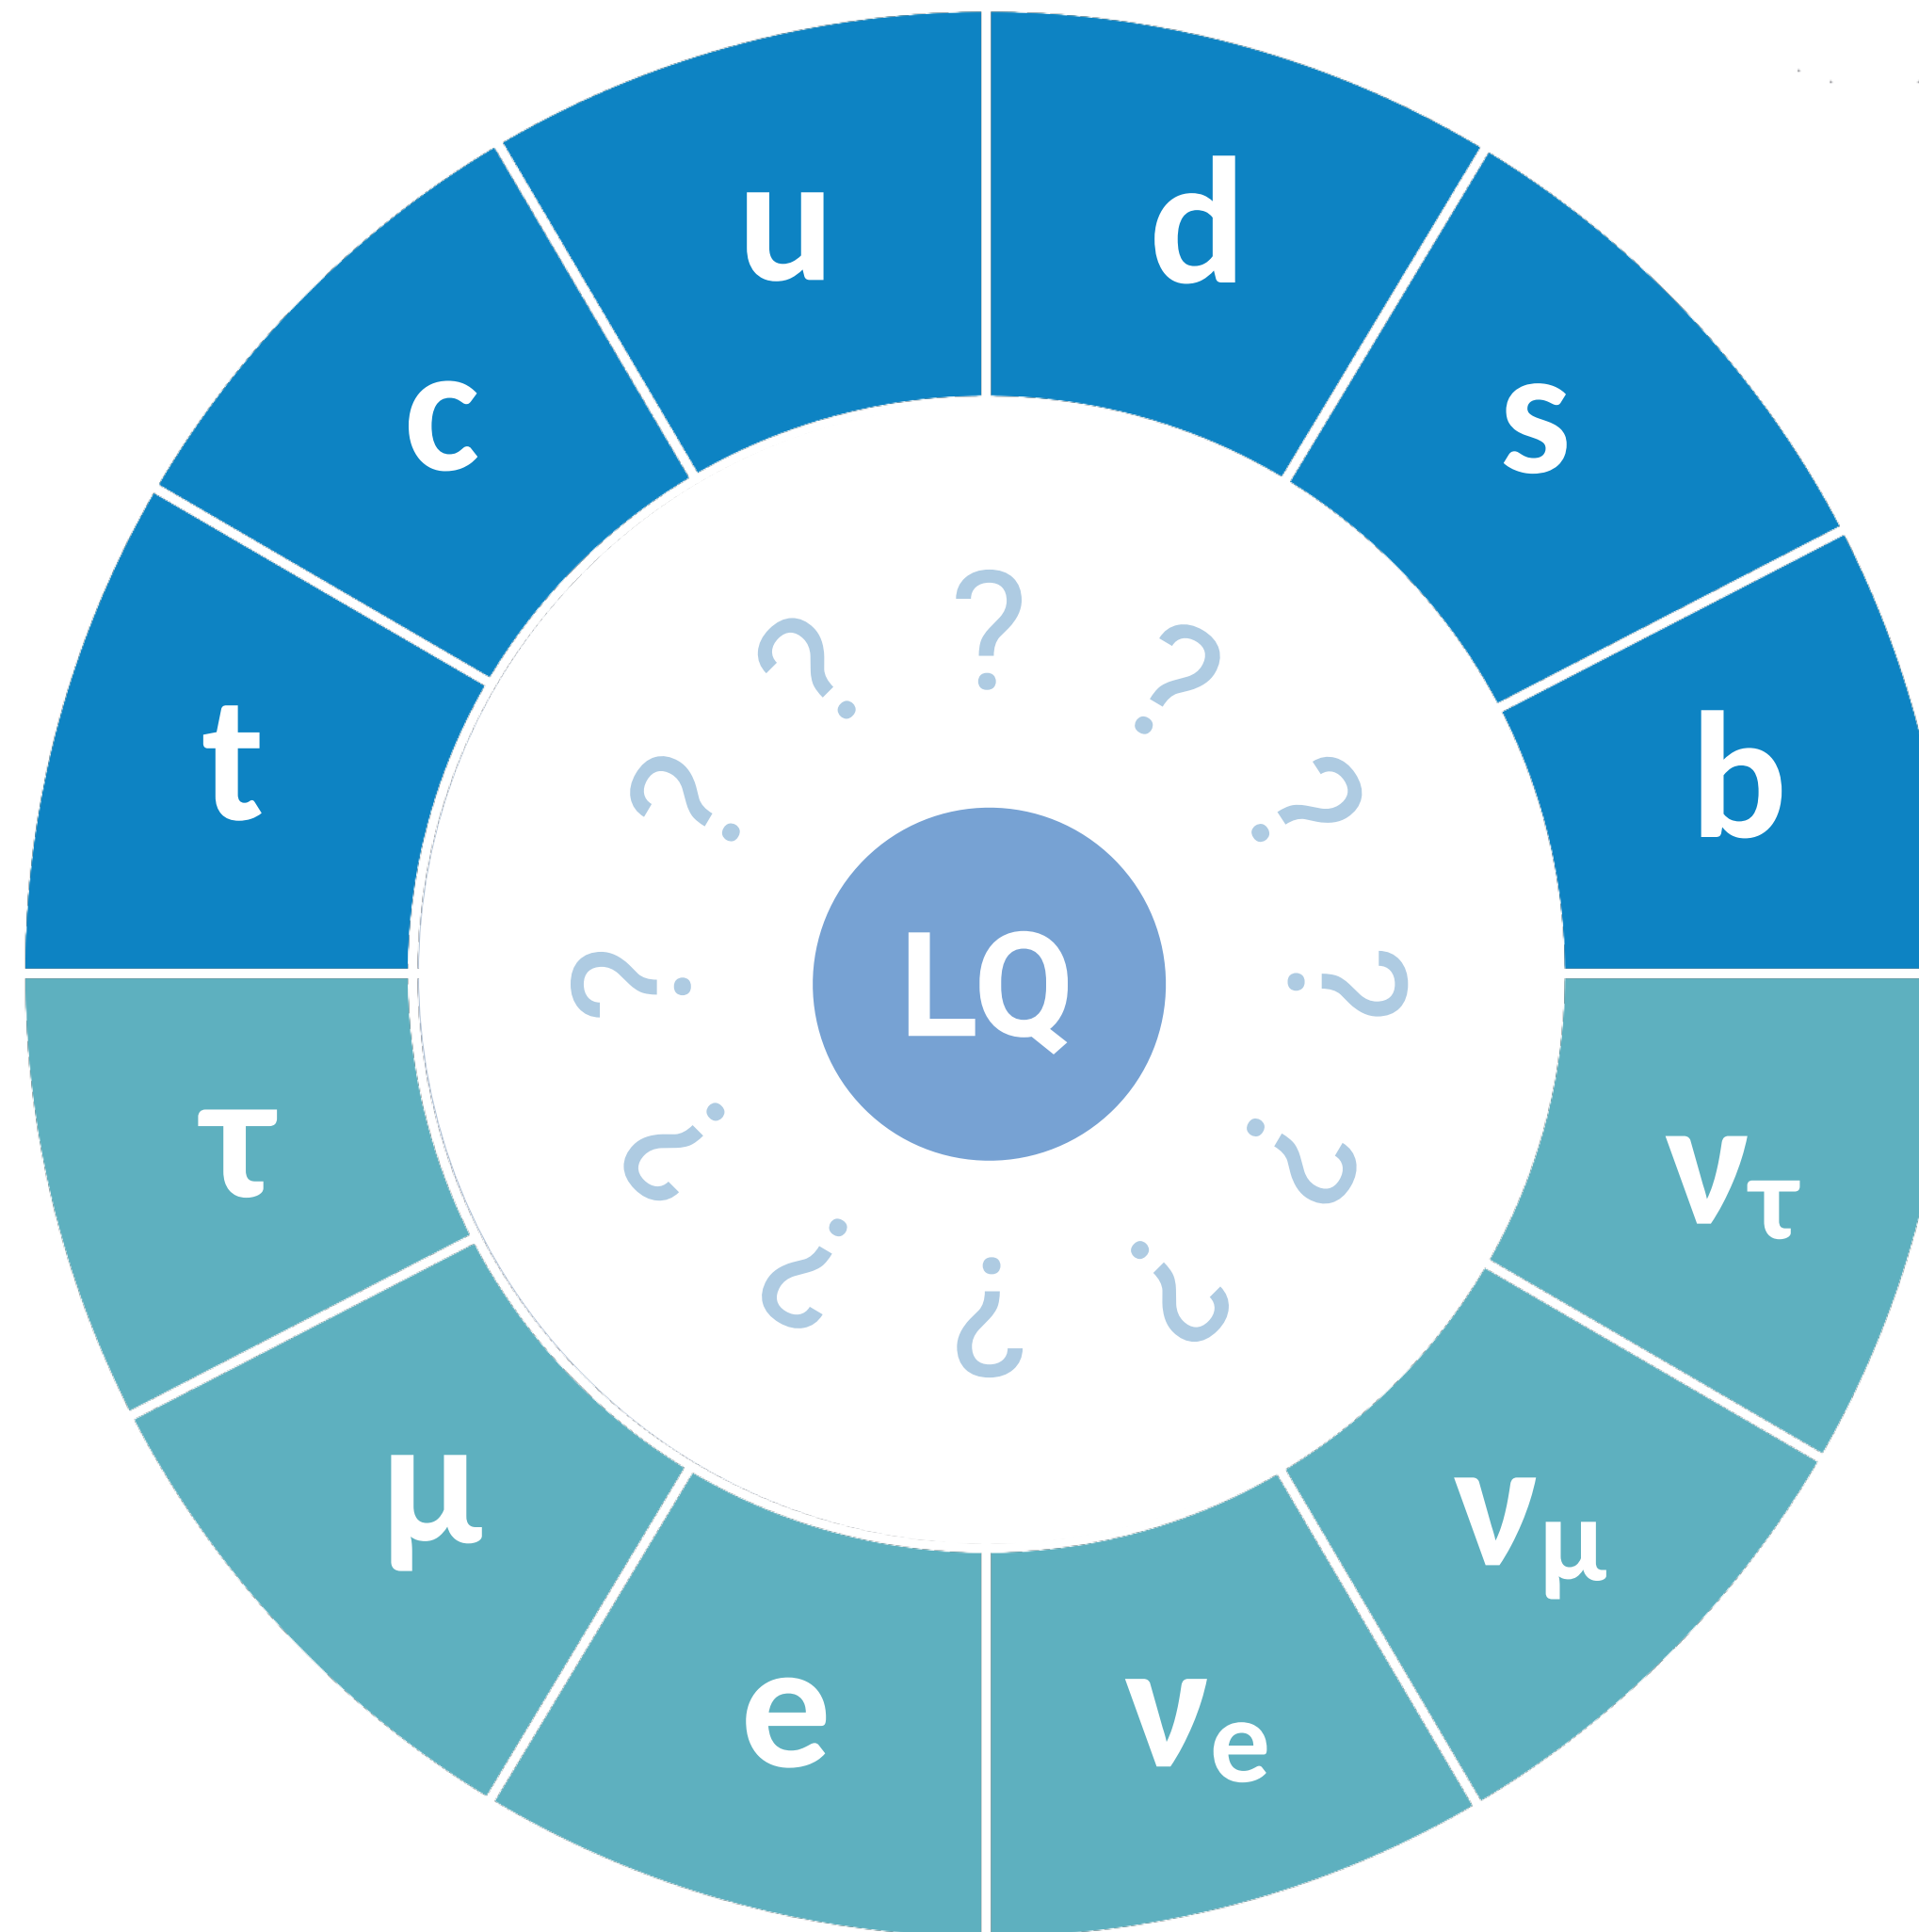

$$R(D^{(*)}) = \frac{BR(B \rightarrow D^{(*)}\tau\nu)}{BR(B \rightarrow D^{(*)}\mu\nu)}$$

# Possible explanation: Leptoquarks

- Motivated by many similarities between quarks and leptons (mass hierarchy, charge cancellation etc).
- Similarities between quarks and leptons suggest a possible link between the two sectors.

→ Leptoquarks: Hypothetical particles which mediate quark-lepton transitions.

[Z.Phys.C74:207-220,1997](#)

# Leptoquarks à la mode

SEARCH RESULTS FOR "LEPTOQUARK" PAPERS ON INSPIRE, BY YEAR

Excesses are diluted/disappear once more data is analysed.  
Direct searches for leptoquarks at HERA and the Tevatron yield null results.

# Leptoquarks à la mode

SEARCH RESULTS FOR "LEPTOQUARK" PAPERS ON INSPIRE, BY YEAR

Belle and BaBar observe  $\sim 3\sigma$  deviations from SM predictions in measurements of  $R_{D^{(*)}}$

# Leptoquarks à la mode

SEARCH RESULTS FOR "LEPTOQUARK" PAPERS ON INSPIRE, BY YEAR

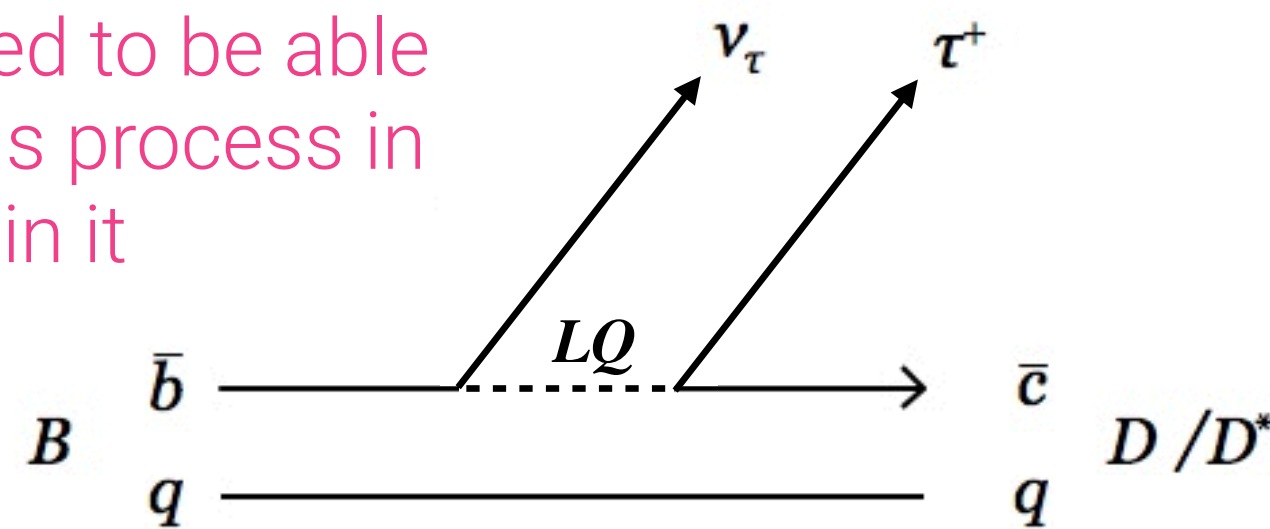

More measurements from LHCb, providing even stronger evidence for lepton non-universality.

# Leptoquarks searches at the LHC

- Can be scalar (spin 0) or vector (spin 1).
- Fractional electric charge:  $|q| = \frac{2}{3}$  (up-type) or  $\frac{1}{3}$  (down-type)
- Pair-production dominant at LHC, but single LQ production important at very high masses.
- Decays to a lepton and a quark:  $LQ \rightarrow \ell^\pm q$ ,  $LQ \rightarrow \nu q$ 
  - Models where the LQ decays to third generation particles (or cross-generational decays, e.g.  $LQ \rightarrow \mu b$ ) favoured theoretically.

Reminder: need to be able to mediate this process in order to explain it

# Leptoquarks searches at the LHC

Many different possible decays, depending on the charge of the leptoquark:

- Up-type 3rd generation:  $LQ \rightarrow t\nu$  and/or  $LQ \rightarrow b\tau$
- Down-type 3rd generation:  $LQ \rightarrow t\tau$  and/or  $LQ \rightarrow b\nu$

# Leptoquarks searches at the LHC

No interesting excesses in the data, but rich phenomenology:

- Single vs. pair-production
- Vector vs. scalar
- Coupling strength of LQ to lepton-quark
- Mass

... and considering all permutations of decays to  $[e, \nu_e, \mu, \nu_\mu, \tau, \nu_\tau] - [u, d, s, c, b, t]$  yields many different final states.

ATLAS results for illustration  
- CMS also has a rich LQ search programme!

# Leptoquarks searches at the LHC

No interesting excesses in the data, but rich phenomenology:

- Single vs. pair-production
- Vector vs. scalar
- Coupling strength of LQ to lepton-quark
- Mass

... and considering all permutations of decays to  $[e, \nu_e, \mu, \nu_\mu, \tau, \nu_\tau] - [u, d, s, c, b, t]$  yields many different final states.

PICTUREQUOTES.COM

PICTUREQUOTES

# Heavy gauge bosons

Flavour anomalies could also be explained by the existence of additional gauge bosons that have flavour-dependent coupling.

More generally, predicted by many models.

# Search for $W' \rightarrow tb$

Phys. Lett. B 820 (2021) 136535

# Search for $Z' \rightarrow tt$

Top quarks from  $Z'$  decay are highly boosted

ATLAS-CONF-2021-048

# Low mass $Z' \rightarrow 4\mu$

- Light  $Z'$  boson couples only to 2nd and 3rd generation leptons.
  - Can explain flavour anomalies,  $\mu(g-2)$ , dark matter, neutrino masses, and more.
- $Z'$  produced through radiation in a Drell-Yan process.
- Search in 4 muon final state.
  - 4- $\mu$  invariant mass =  $Z$  mass.
  - Combinatorial challenge to choose which two muons coming from the  $Z'$ .

[Phys. Lett. B 792 \(2019\) 345](#)

# Testing lepton universality in W decays

Nature Physics 17, 813–818 (2021)

*Taus have a relatively long lifetime - muons originating from a tau decay will point away from the primary vertex (i.e. have a large  $d_0$  impact parameter).*

Combined results from LEP experiments showed a  $2.7\sigma$  deviation from the SM expectation in  $R(\tau/\mu)$  measurements. ATLAS result compatible with the SM.

→ often anomalies just... disappear...

# Extended Higgs sector

Higgs bosons interaction strength proportional to mass  $\rightarrow$  possible link to flavour anomalies?

The Higgs boson is the only Spin 1 particle in the SM, but many BSM theories predict there should be additional Higgs bosons.

Higgs cross-section is small and many production/decay modes very challenging to probe  $\rightarrow$  still plenty of room for new physics that interacts with the Higgs to be hiding.

# Extended Higgs sector

Higgs bosons interaction strength proportional to mass  $\rightarrow$  possible link to flavour anomalies?

The Higgs boson is the only Spin 1 particle in the SM, but many BSM theories predict there should be additional Higgs bosons.

Higgs cross-section is small and many production channels are very challenging to probe. There is plenty of room for new physics that interacts with the Higgs to be hiding.

**TOMORROW**

# Back Up

# Revisiting the proton

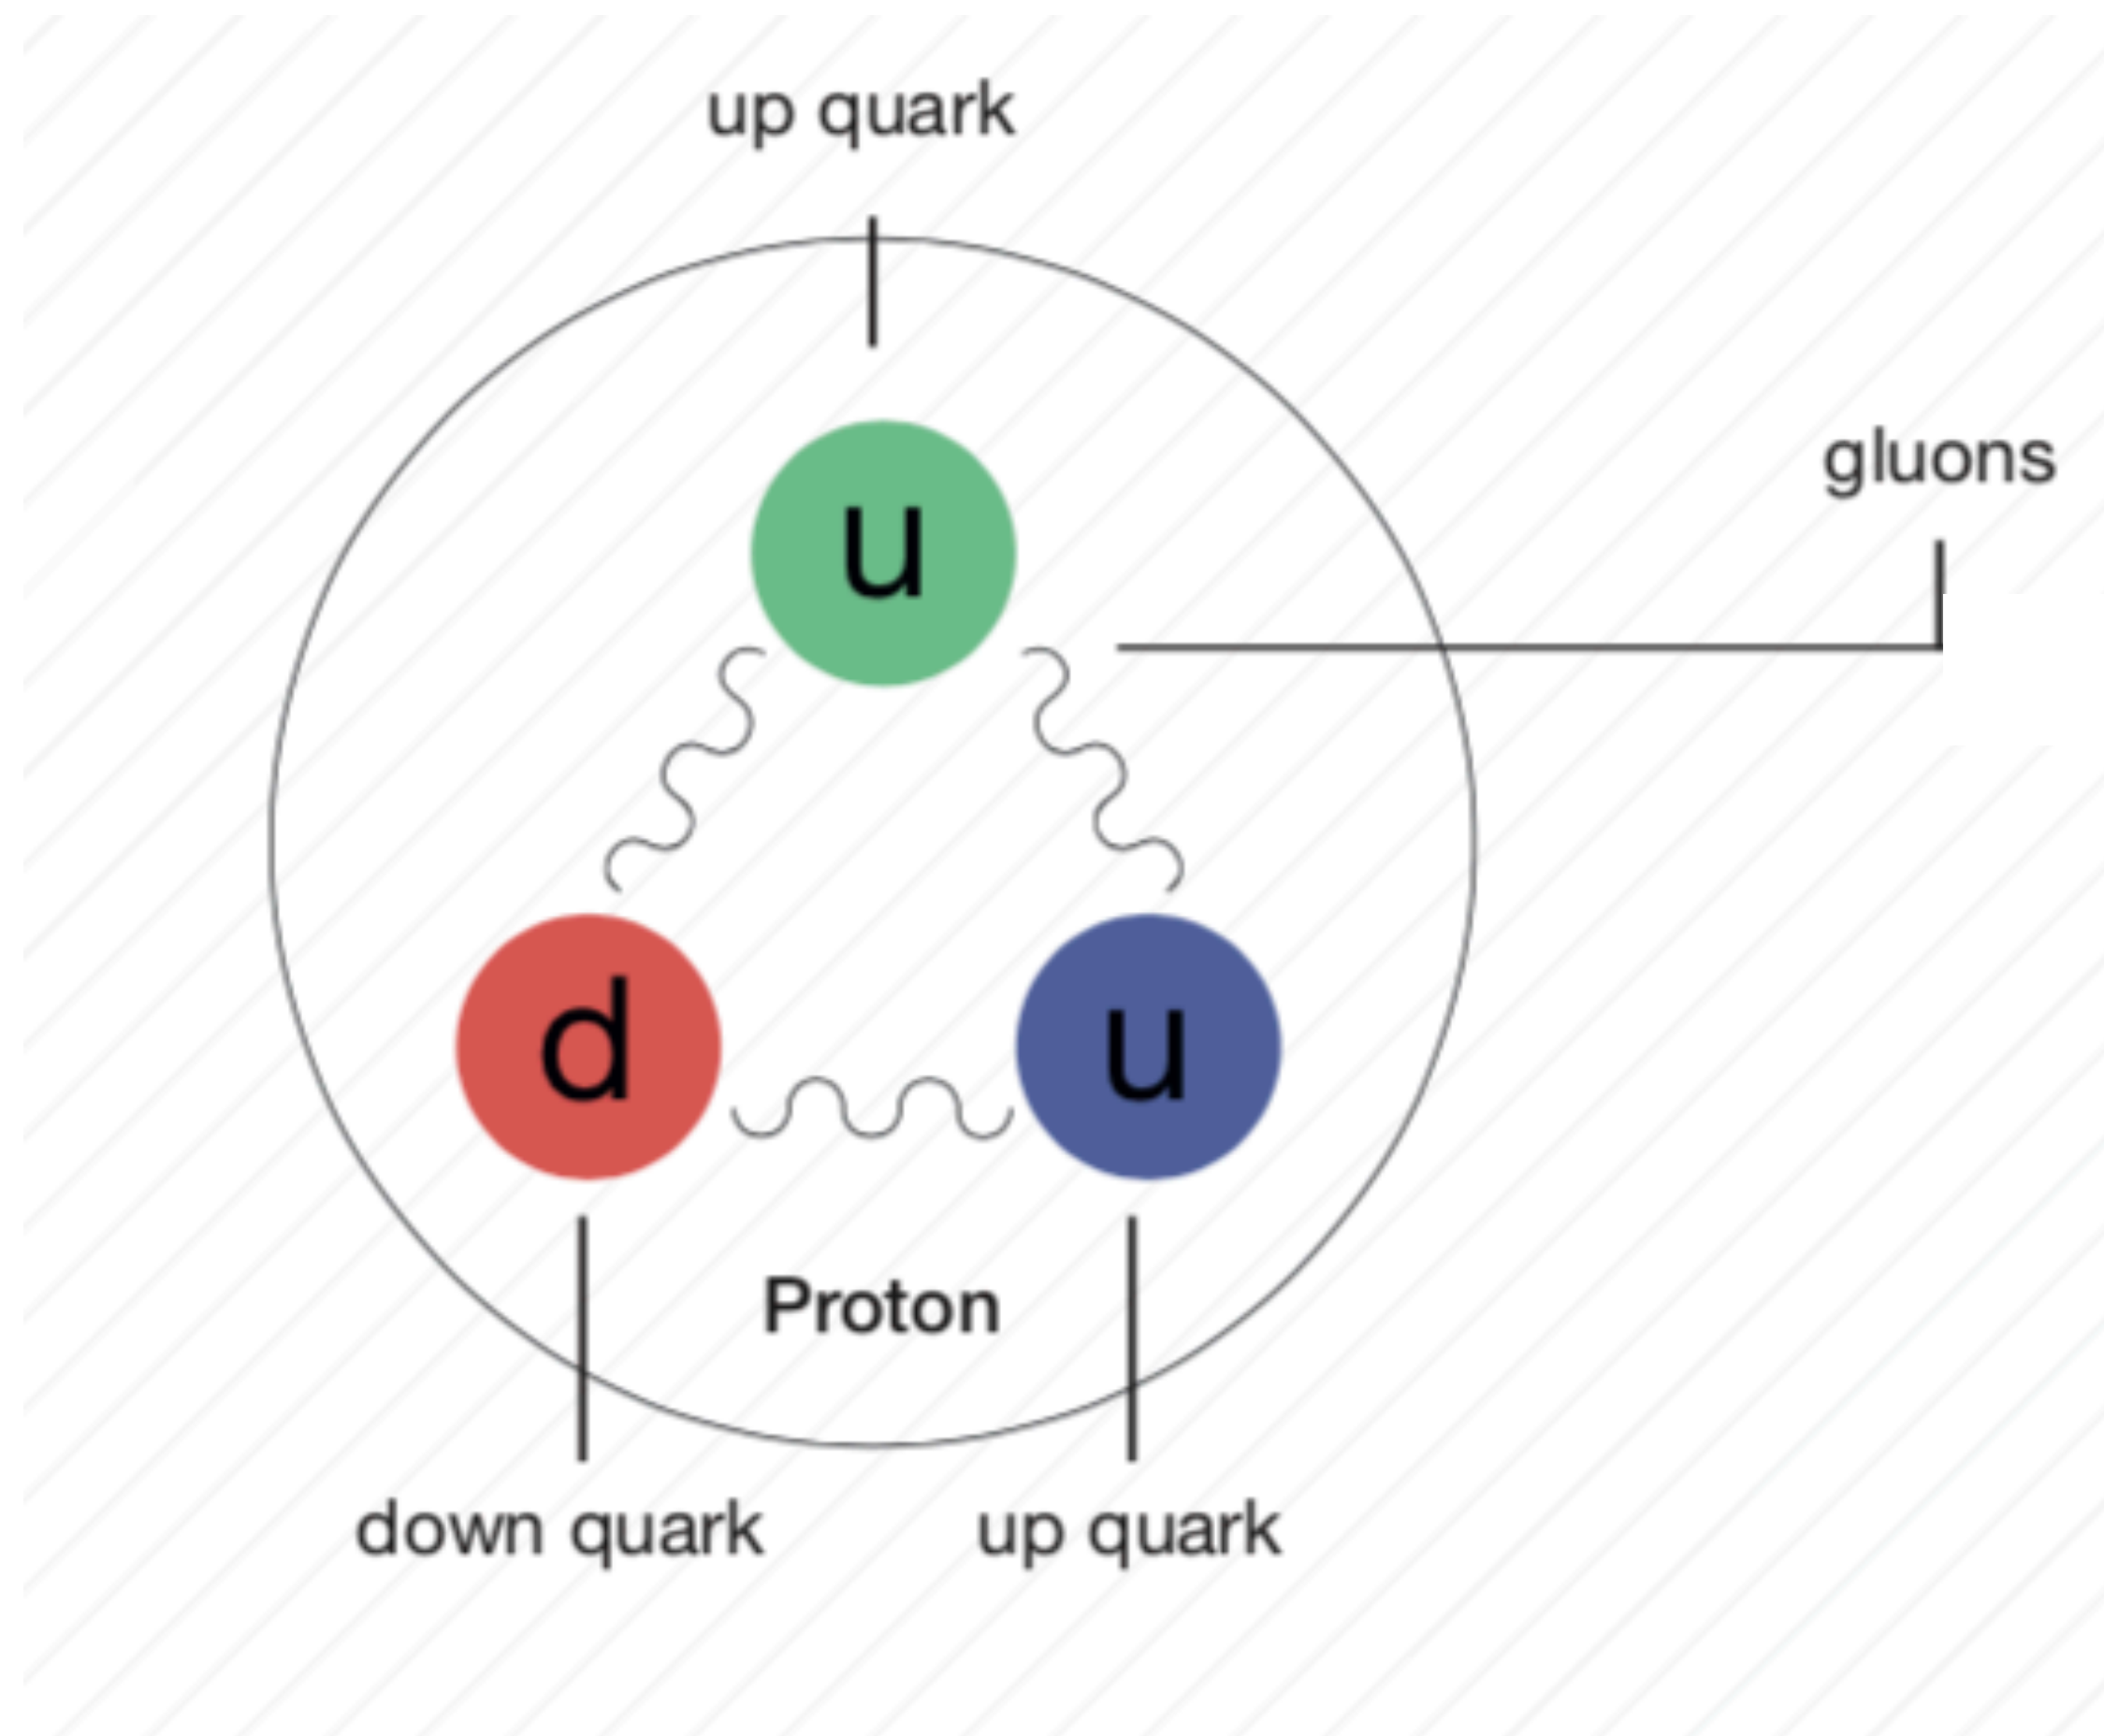

Simplified picture of a proton:

- 3 primary quarks
  - 2 up-quarks
  - 1 down-quark
- Quarks are bound together by the strong force (carried by gluons)

# Revisiting the proton

Simplified picture of a proton:

- 3 primary quarks
  - 2 up-quarks
  - 1 down-quark
- Quarks are bound together by the strong force (carried by gluons)

This picture is otherwise horribly wrong!

# Revisiting the proton

(Slightly) more accurate picture of a proton:

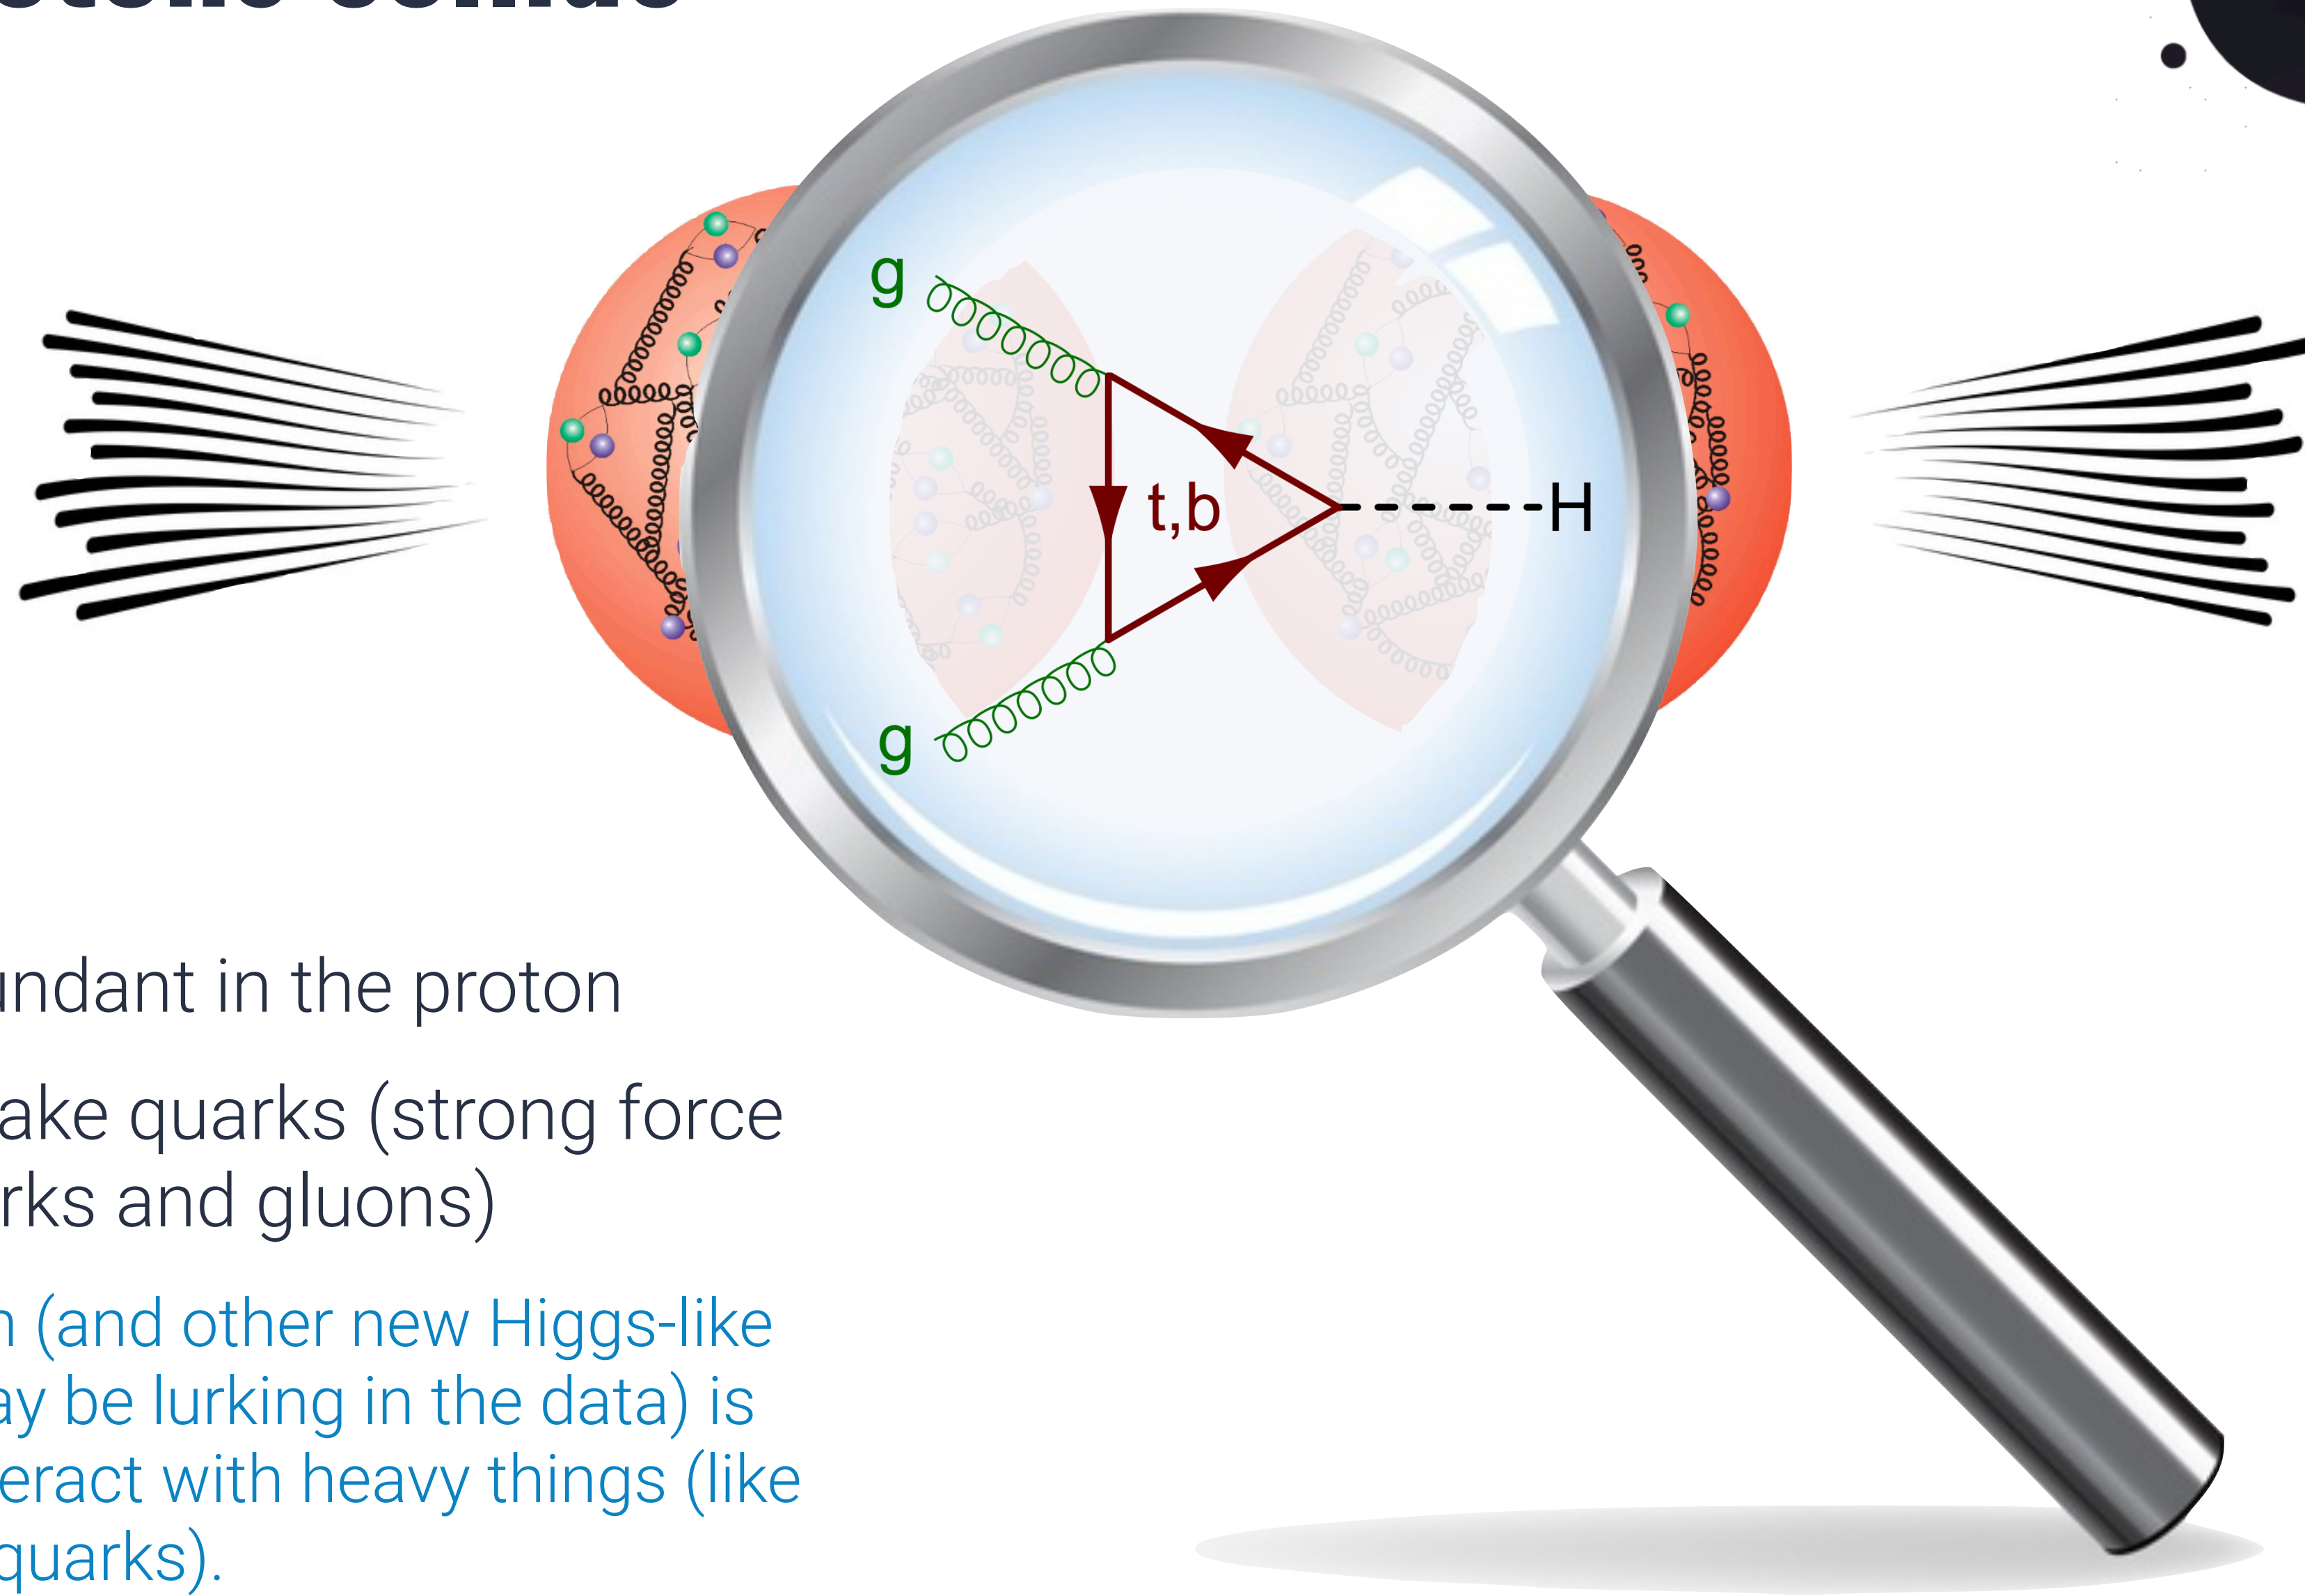

Most of the proton's structure comes from the activity of the gluons, and the fact that virtual quark–anti-quark pairs are popping in and out of existence (thanks to the strong energy field).

# When protons collide

The energy carried by all of the quarks and gluons inside the proton can be used to create new heavy particles.

# When protons collide

Gluons are abundant in the proton

They love to make quarks (strong force couples to quarks and gluons)

The Higgs boson (and other new Higgs-like particles that may be lurking in the data) is most likely to interact with heavy things (like top and bottom quarks).
