

# Simulations for TCDI – Collimators in the Transfer Line

- ❑ Locations and Settings of the TCDI collimators: HB
  - ❑ Length of the collimators.
    - ❑ Criteria: Protection of equipment downstream in case of beam loss.
- FLUKA simulations: calculation of temperature rise in equipment

# Geometry for Simulations:

Gap between collimator jaws: 5.69 mm  
Simulation for simplified model: cylinders, parallelepipeds

**Magnet:**

# Input for Simulation

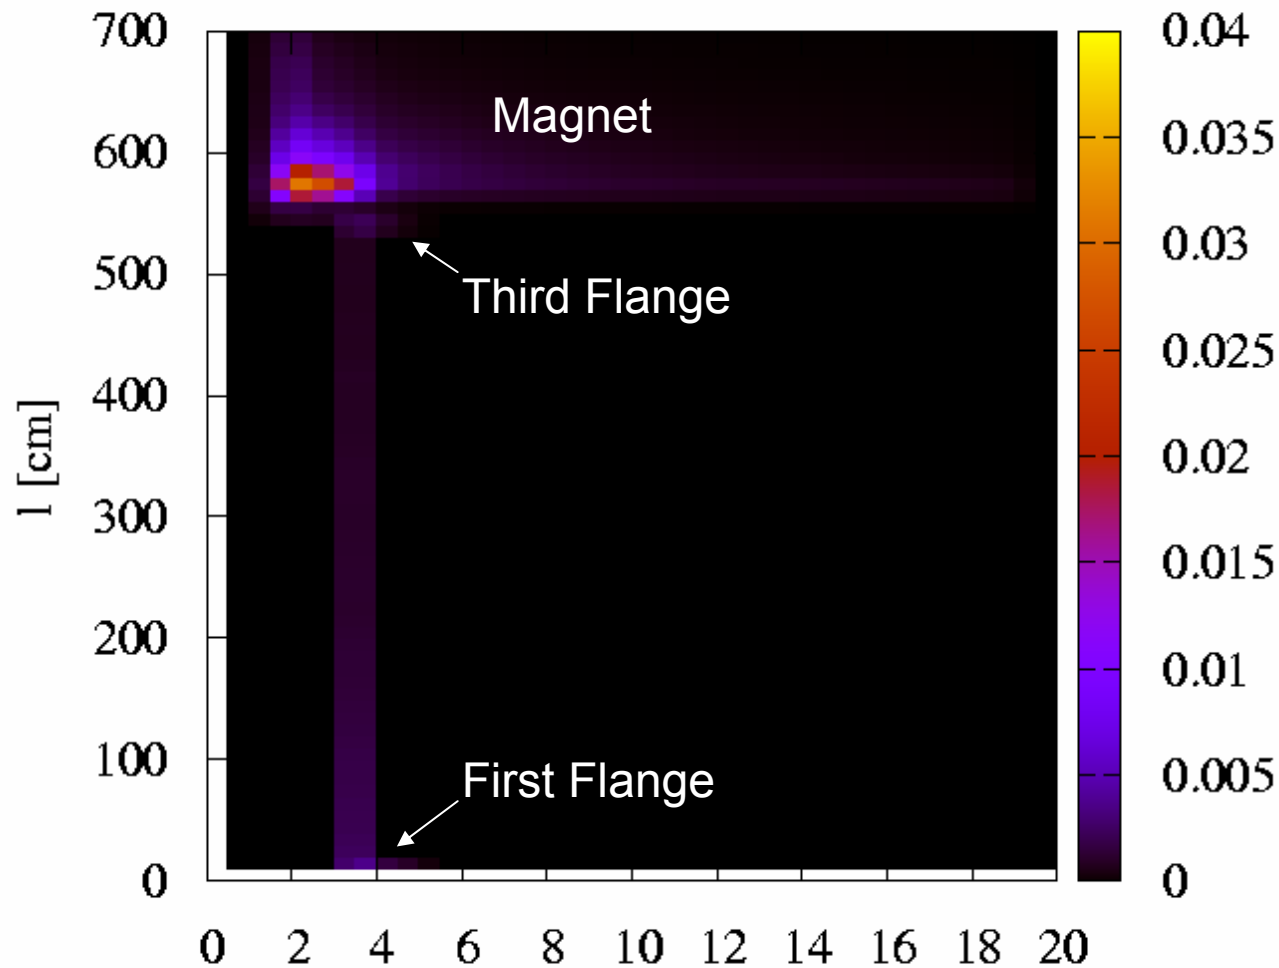

- ❑ Scenario:  
full batch (288 bunches, 450 GeV) impacting with  $1\sigma$  impact parameter on collimator jaw. Pencil Beam. Nominal Intensity. (Simulation:  $2 \cdot 10^3$  particles)
- ❑ Jaw length: 2m, 2.5m, 3m
- ❑ Transverse dimensions: 4cm x 5cm

**$1\sigma$  impact parameter → Out-scattering from the jaw surface**

# Most Energy Deposition in the Magnet

Energy Deposition downstream of collimator, beam impact parameter:  $1 \sigma$ , pencil beam

# 2m Collimator Jaw: $1\sigma$ impact parameter

Temperature Rise in first Flange, Iron, ( $r_2=4.75$ ,  $r_1=3$ )

# 2m Collimator Jaw: $1\sigma$ impact parameter

Temperature Rise in third Flange, Iron, ( $r_2=4.75$ ,  $r_1=1.45$ )

# 2m Collimator Jaw: $1\sigma$ impact parameter

Temperature Rise in Magnet, Iron Cylinder ( $r_2=19\text{cm}$ ), Copper Cylinder ( $r_1=1.45\text{cm}$ ,  $r_2=3.45\text{cm}$ )

# 2m Collimator Jaw: $1\sigma$ impact parameter

Temperature Rise in Magnet, Copper Cylinder ( $r_1=1.45\text{cm}$ ,  $r_2=3.45\text{cm}$ )

# Jaw length 2m, 2.5m and 3m: Comparison: Magnet

Copper part in magnet, 10th bin for 2mjaw, 9th bin for 2.50mjaw, 8th bin for 3mjaw

# Approximate Numbers: pencil beam, $1\sigma$ impact parameter

Temperature Rise, 3m Jaw, pencil beam

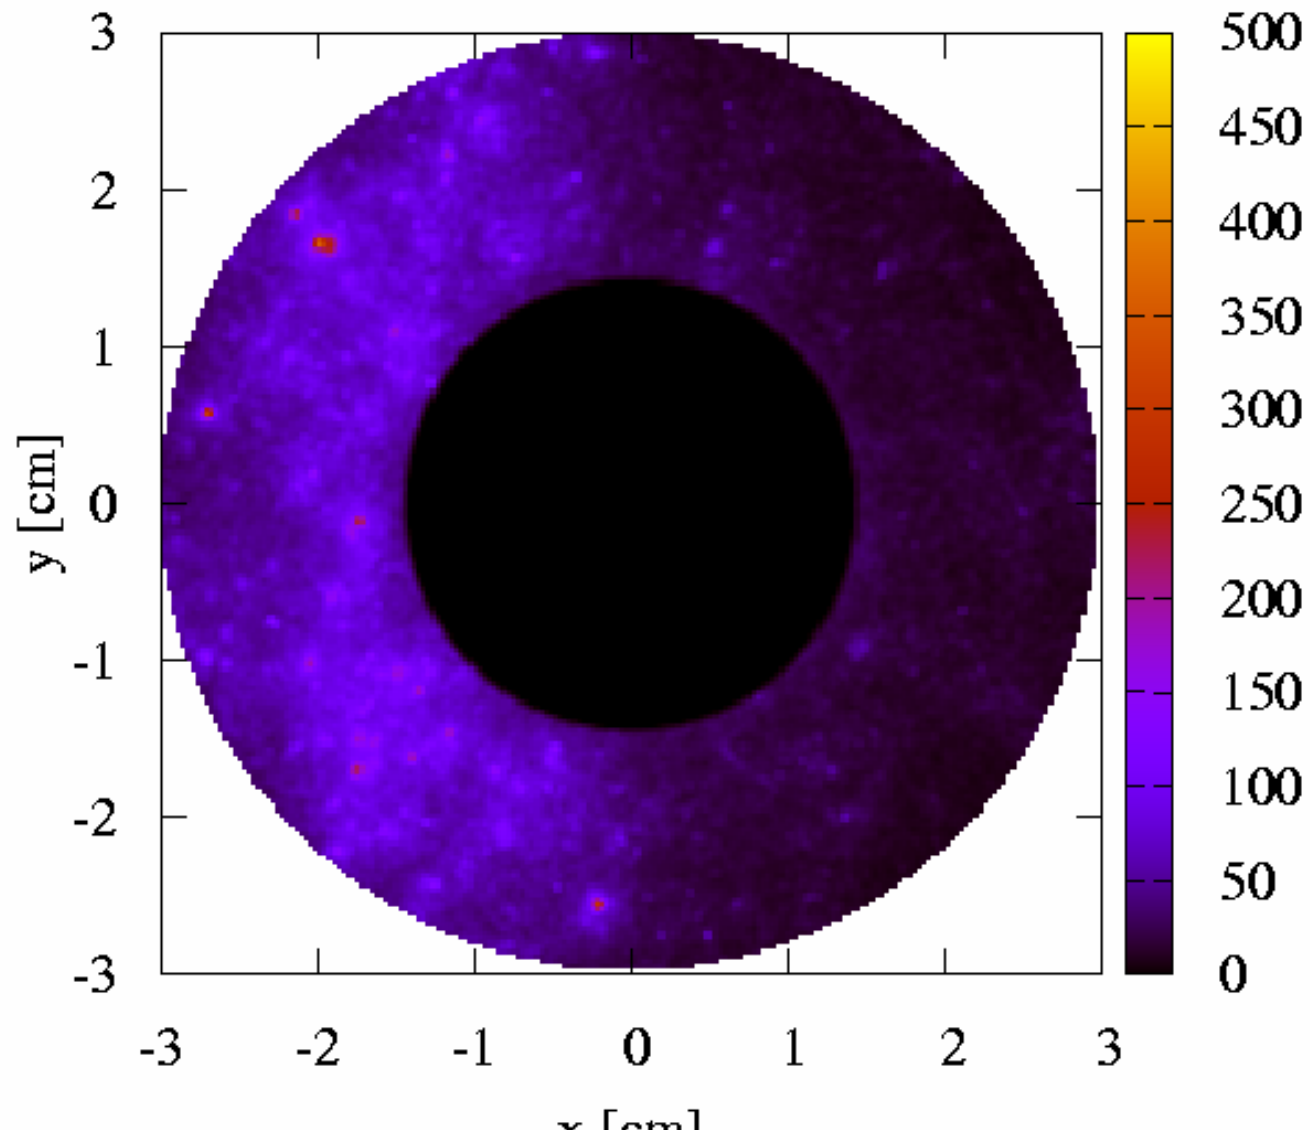

Temperature Rise [K]

	flange1	flange3	Cu
3m	50	35	140
2m	60	40	210

# 3m Collimator Jaw: $1\sigma$ impact parameter

Temperature Rise in Magnet, Copper Cylinder ( $r_1=1.45\text{cm}$ ,  $r_2=3.45\text{cm}$ )

# Other Scenarios and Checks...

- ❑ 3m jaw,  $10^4$  particles,  $1\sigma$  impact parameter, pencil beam
- ❑ 2m jaws: longer longitudinal gap, wider gap between jaws
- ❑ Simulations with Gaussian distribution in  $x$  and  $x'$ 
  - ❑ full batch (288 bunches, 450 GeV). Nominal Intensity.
  - ❑ Jaw length: 2m, 3m
- ❑ Different impact parameters:
  - ❑ full batch (288 bunches, 450 GeV). Nominal Intensity.
  - ❑ 3m jaw:  $0\sigma$ ,  $0.25\sigma$ ,  $0.5\sigma$ ,  $1.5\sigma$
- ❑ Impact parameter of  $(1.5\text{cm-gap}/2)$ :
  - ❑ full batch (288 bunches, 450 GeV). Nominal Intensity. Gaussian Beam.
  - ❑ Jaw length: 2m, 3m

# 3m jaw: 10k particles, $1\sigma$ impact parameter

Temperature Rise at first Flange, Iron, ( $r_2=4.75\text{cm}$ ,  $r_1=3\text{cm}$ )

# 3m jaw: 10k particles, $1\sigma$ impact parameter

Temperature Rise in third Flange, Iron, ( $r_2=4.75$ ,  $r_1=1.45$ )

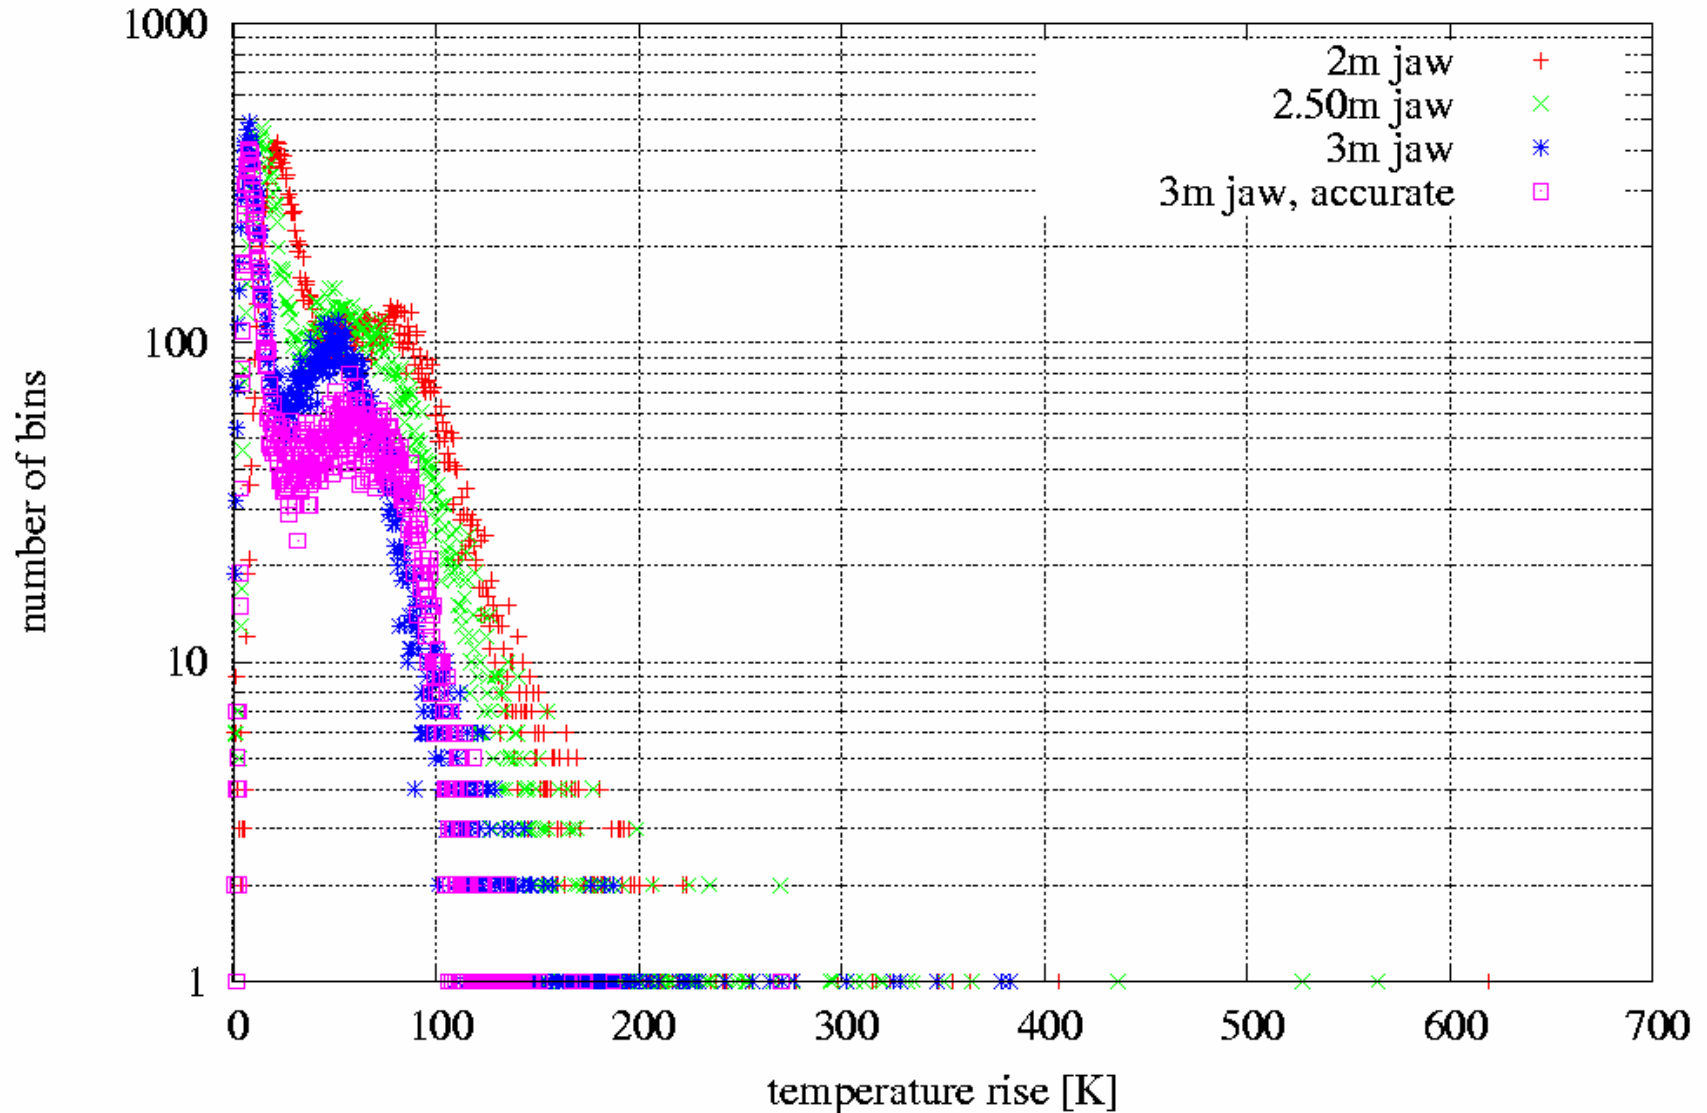

# 3m jaw: 10k particles, $1\sigma$ impact parameter

Temperature Rise in Magnet, Copper Cylinder ( $r_1=1.45\text{cm}$ ,  $r_2=3.45\text{cm}$ )

# 3m jaw: 10k particles, $1\sigma$ impact parameter

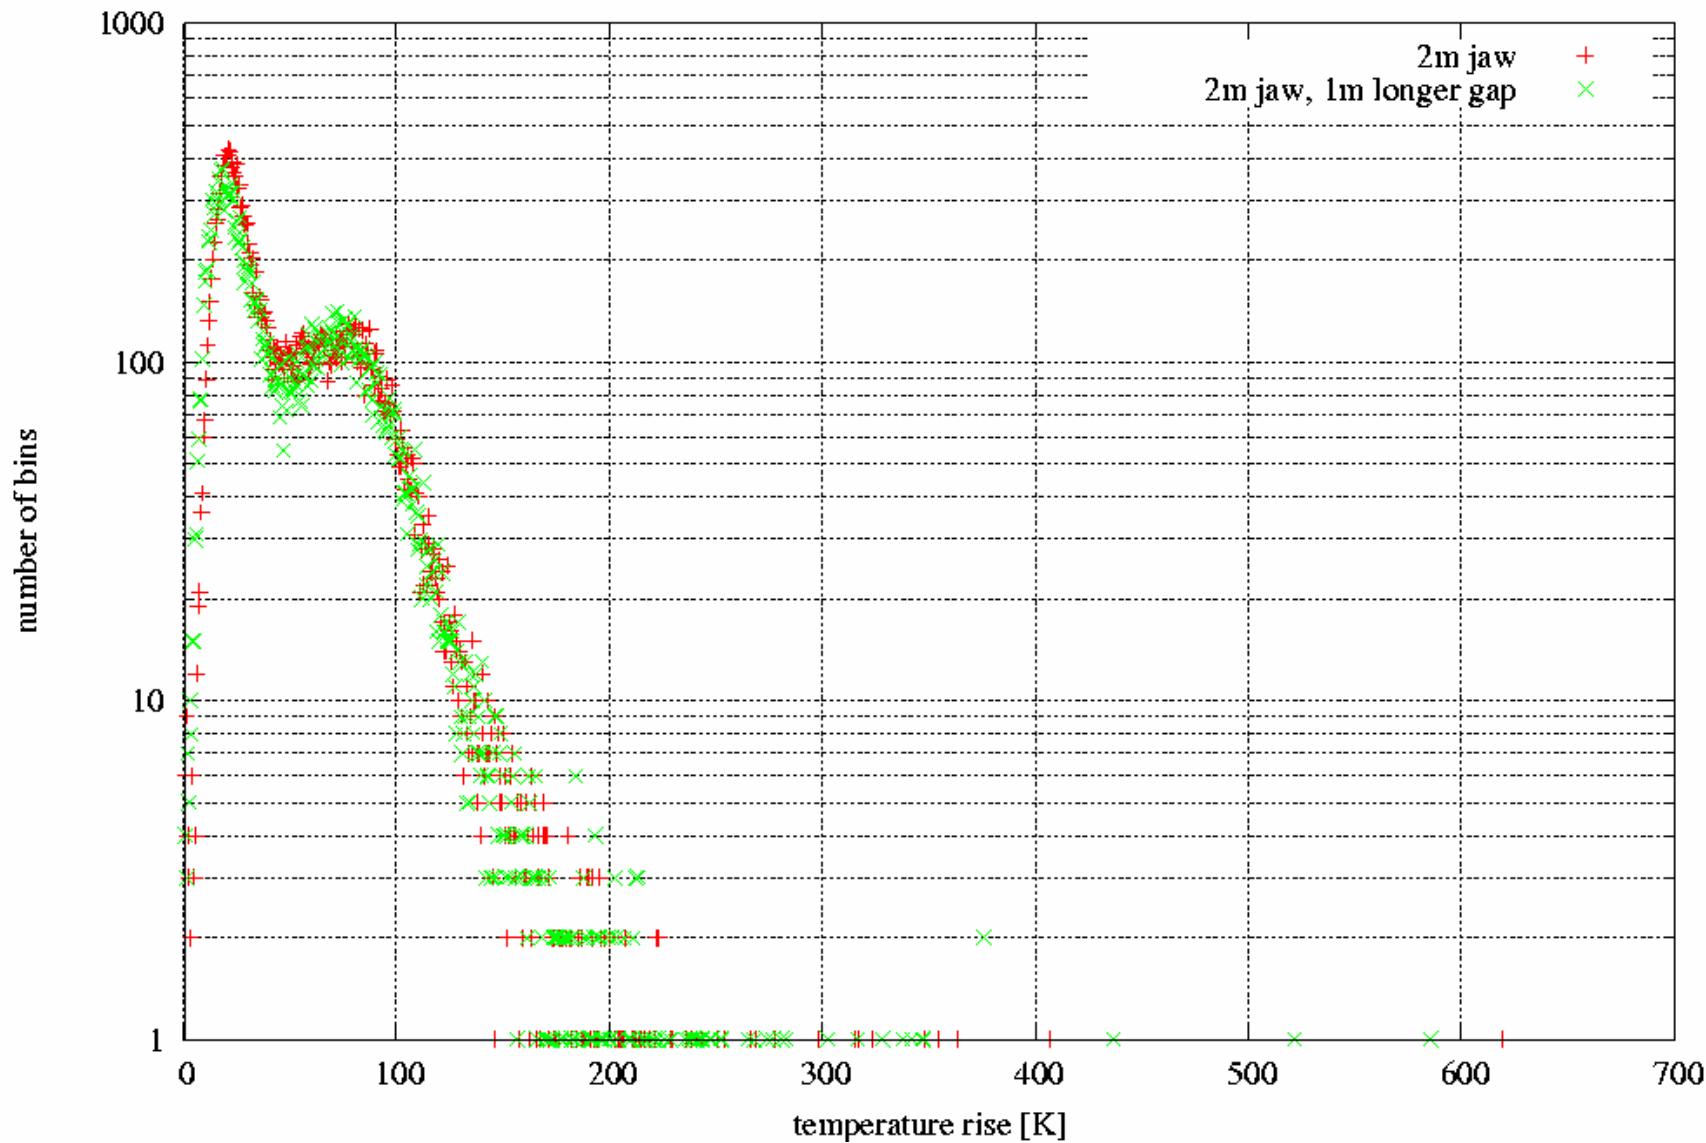

Copper part in magnet, 10th bin for 2mjaw, 9th bin for 2.50mjaw, 8th bin for 3mjaw

# 2m jaw: 1m longer gap before first flange

Copper part in magnet, 2m jaw, 10th bin

# 2m jaw: gap of 6.83 mm between jaws

Copper part in magnet, 2m jaw, 10th bin

# 3m jaw: Gaussian beam, $1\sigma$ impact parameter

Temperature Rise at first Flange, beam pipe, Iron, ( $r_2=4.75\text{cm}$ ,  $r_1=3\text{cm}$ )

# 3m jaw: Gaussian beam, $1\sigma$ impact parameter

Temperature Rise in third Flange, Iron, ( $r_2=4.75$ ,  $r_1=1.45$ )

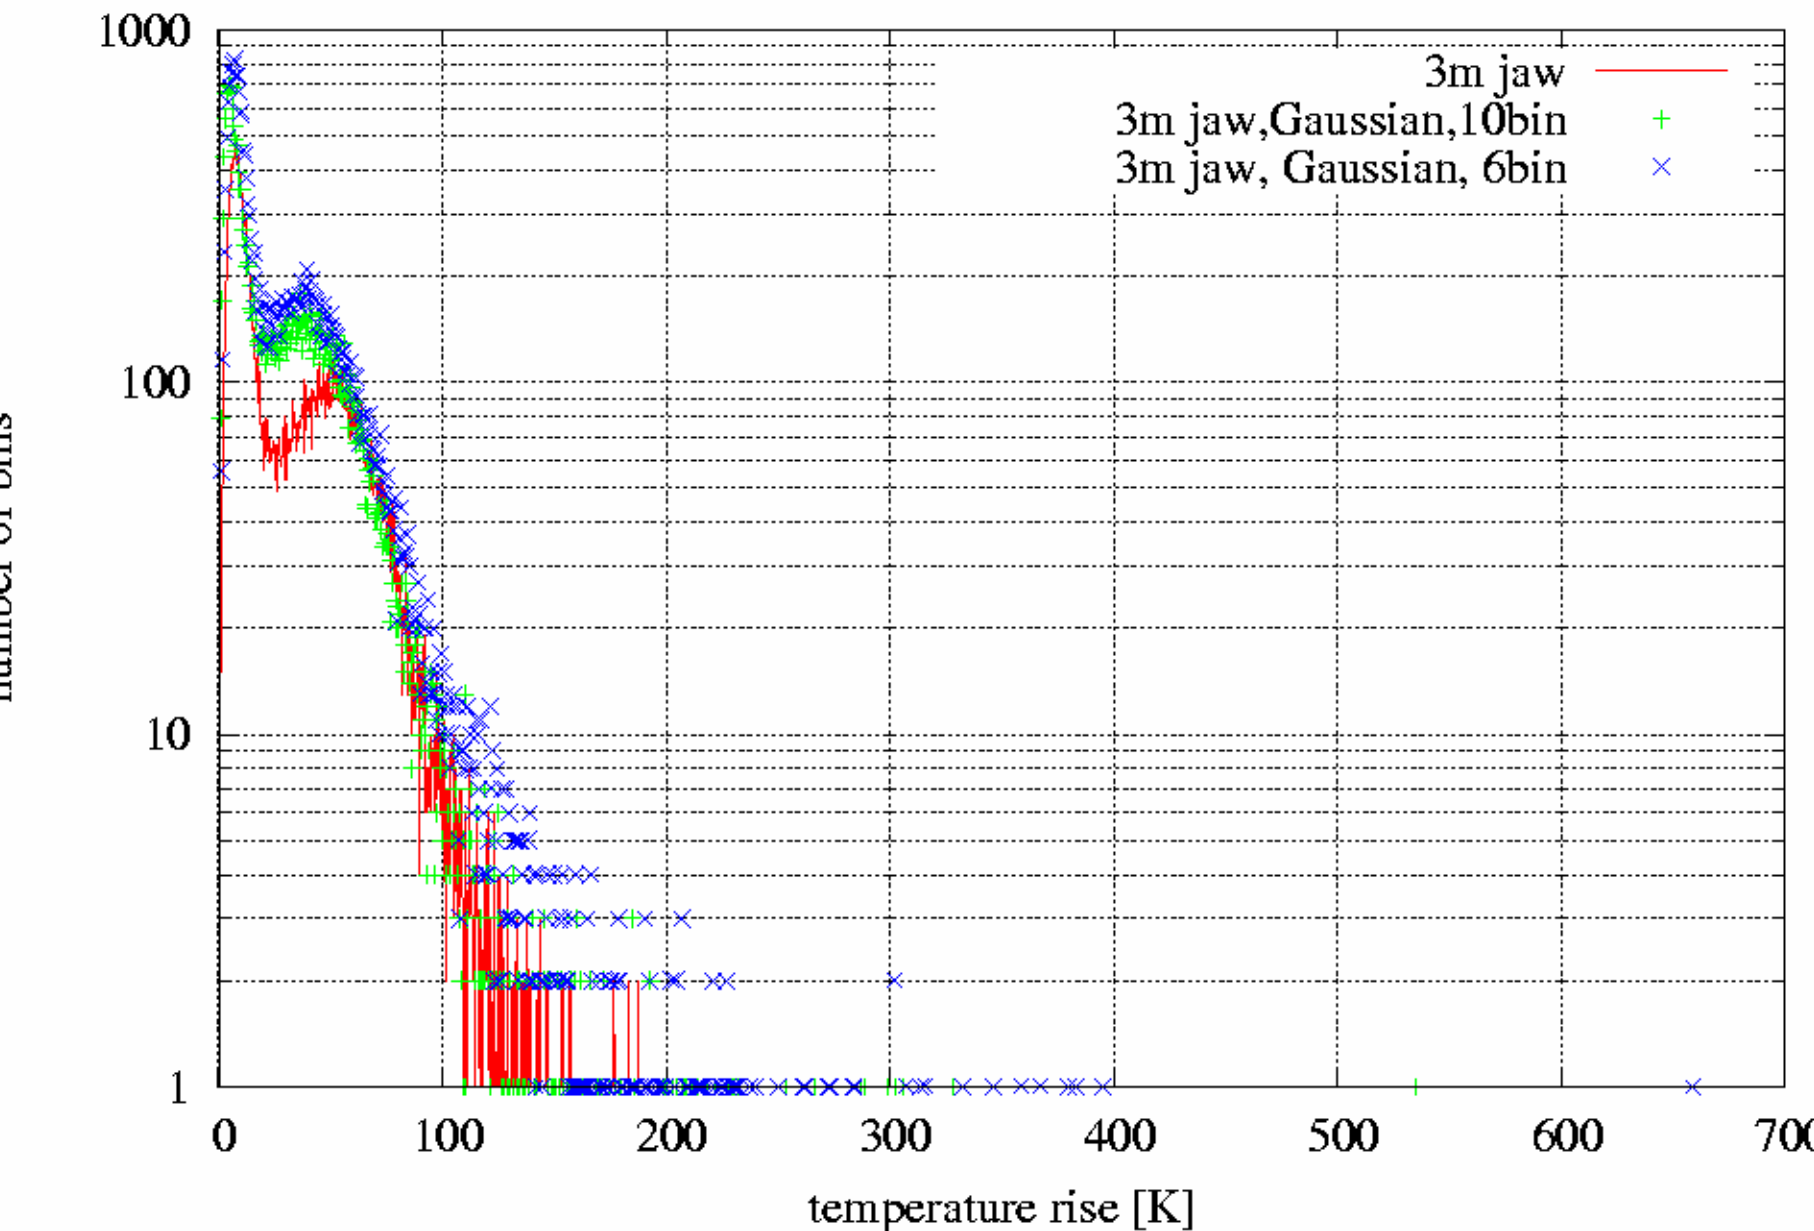

# 3m jaw: Gaussian beam, $1\sigma$ impact parameter

Temperature Rise in Magnet, Copper Cylinder ( $r_1=1.45\text{cm}$ ,  $r_2=3.45\text{cm}$ )

Copper part in magnet; comparison 3m jaw: pencil beam, Gaussian beam

# 3m jaw: Gaussian beam, 1.5cm-gap/2 impact parameter

Temperature Rise at First Flange, Iron, ( $r_2=4.75\text{cm}$ ,  $r_1=3\text{cm}$ )

# 3m jaw: Gaussian beam, 1.5cm-gap/2 impact parameter

Temperature Rise in Magnet, Copper Cylinder ( $r_1=1.45\text{cm}$ ,  $r_2=3.45\text{cm}$ )

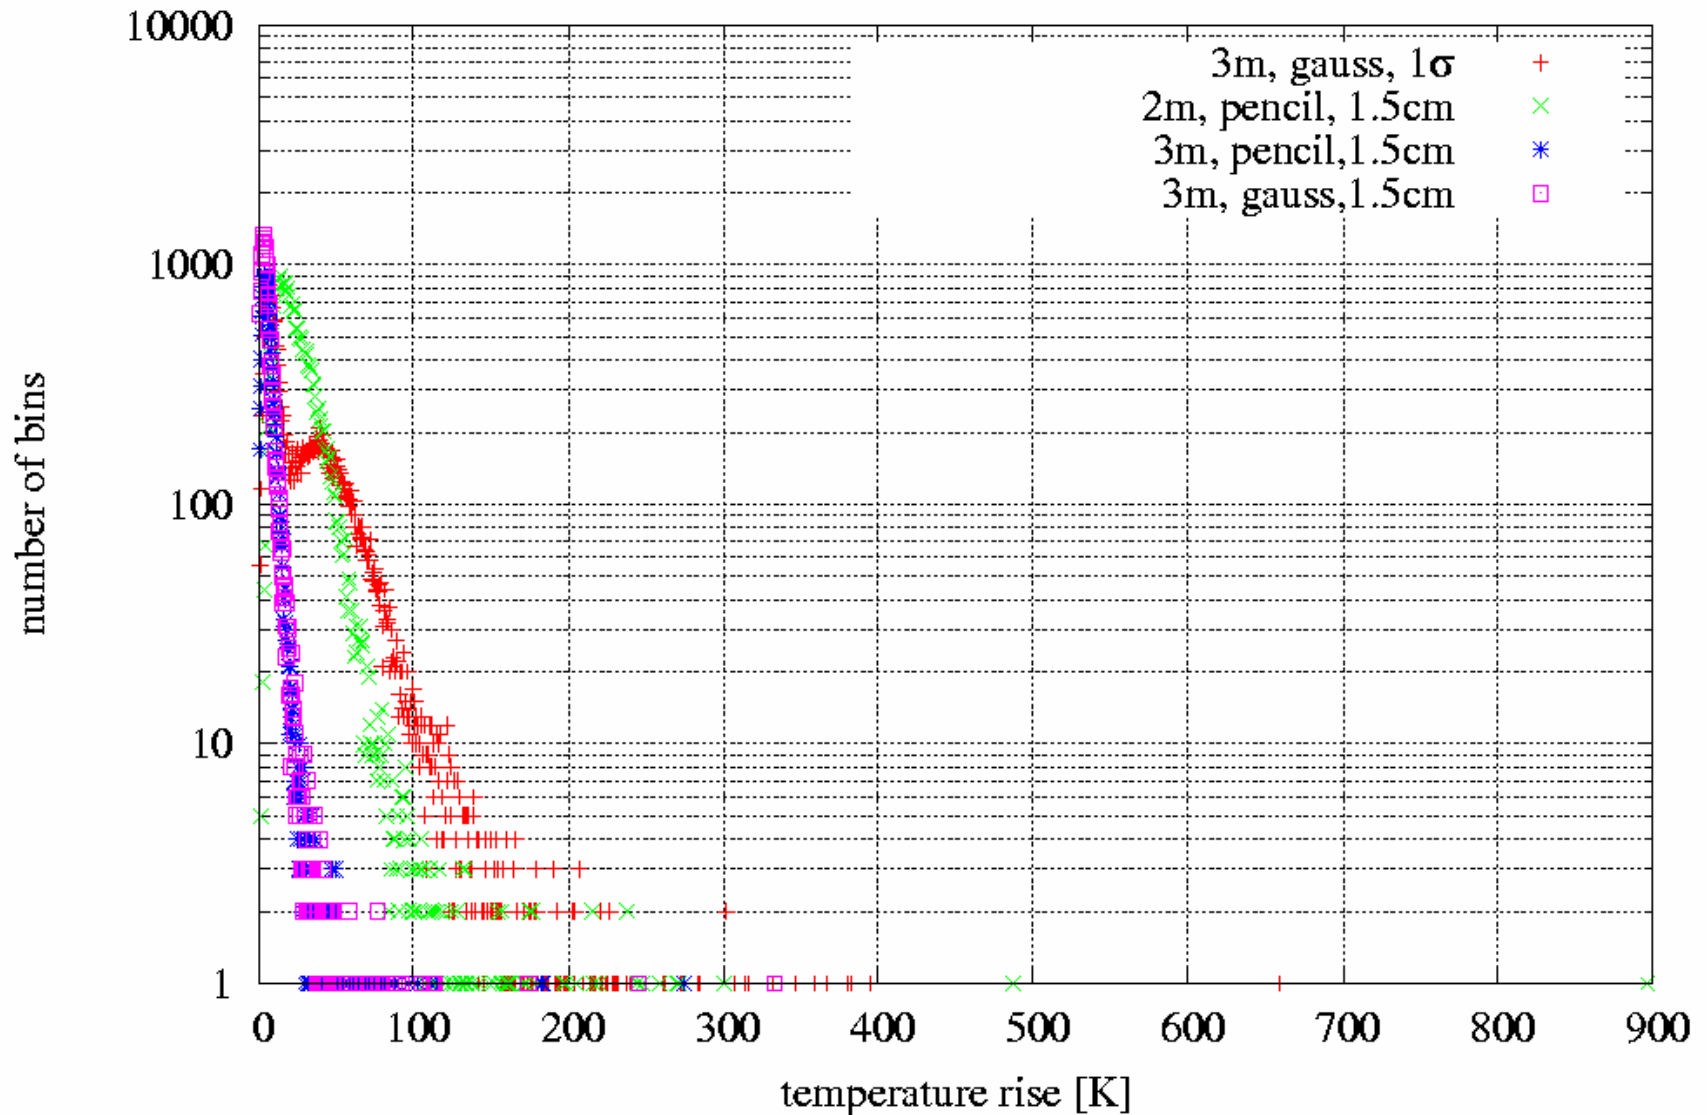

# 1.5cm-gap/2 impact parameter

First Flange

# 1.5cm-gap/2 impact parameter

Copper part in magnet

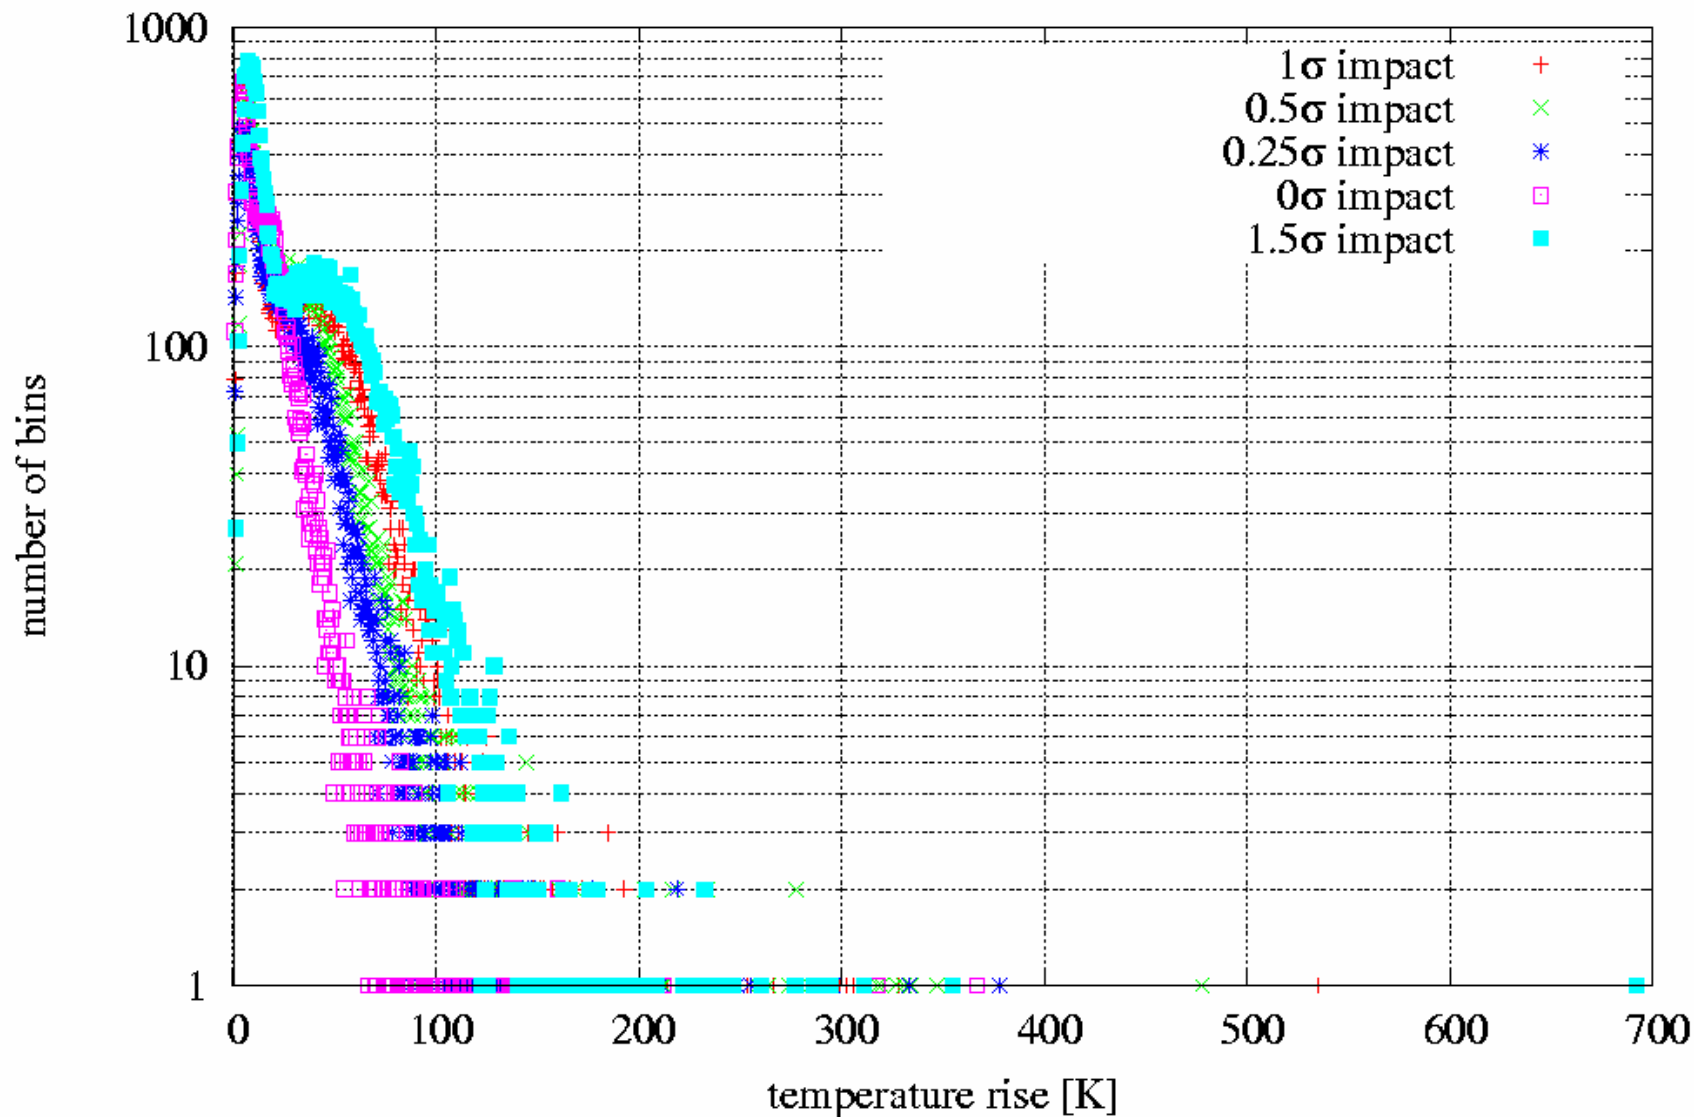

# 3m Jaw, Gaussian Beam, different Impact Parameters

First Flange, 3m Jaw, Gaussian Beam

# 3m Jaw, Gaussian Beam, different Impact Parameters

Copper part in magnet, 3m Jaw

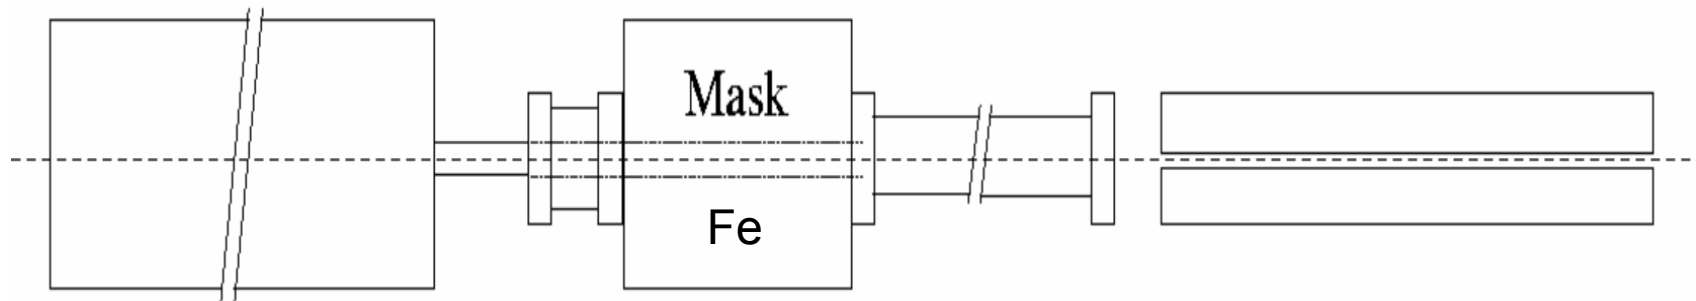

# Out-scattering might be a problem...

- ❑ 3m Jaws (Gaussian beam):  $\Delta T \sim 180\text{K}$  in Cu of magnet
- ❑ **Solution: Additional shielding (Mask, Fe) to protect magnet**

Original Layout

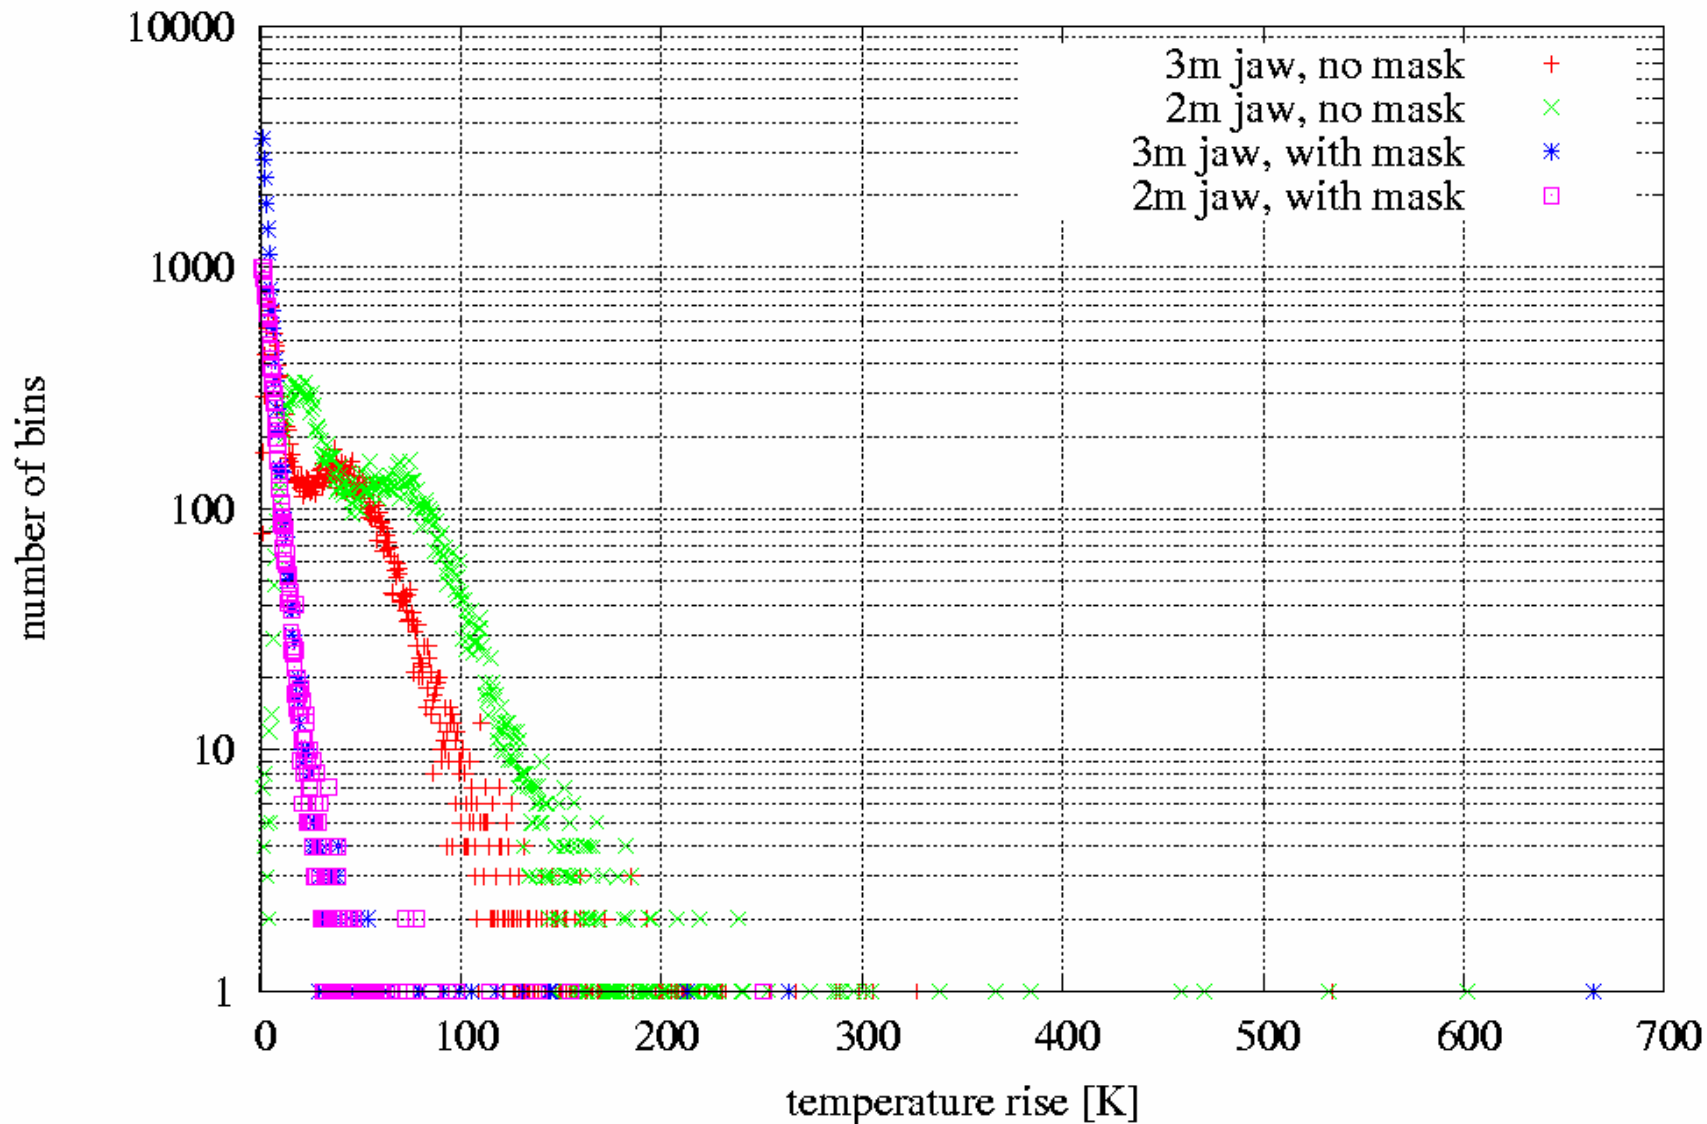

Layout with Mask (same diameter as magnet), additional flang

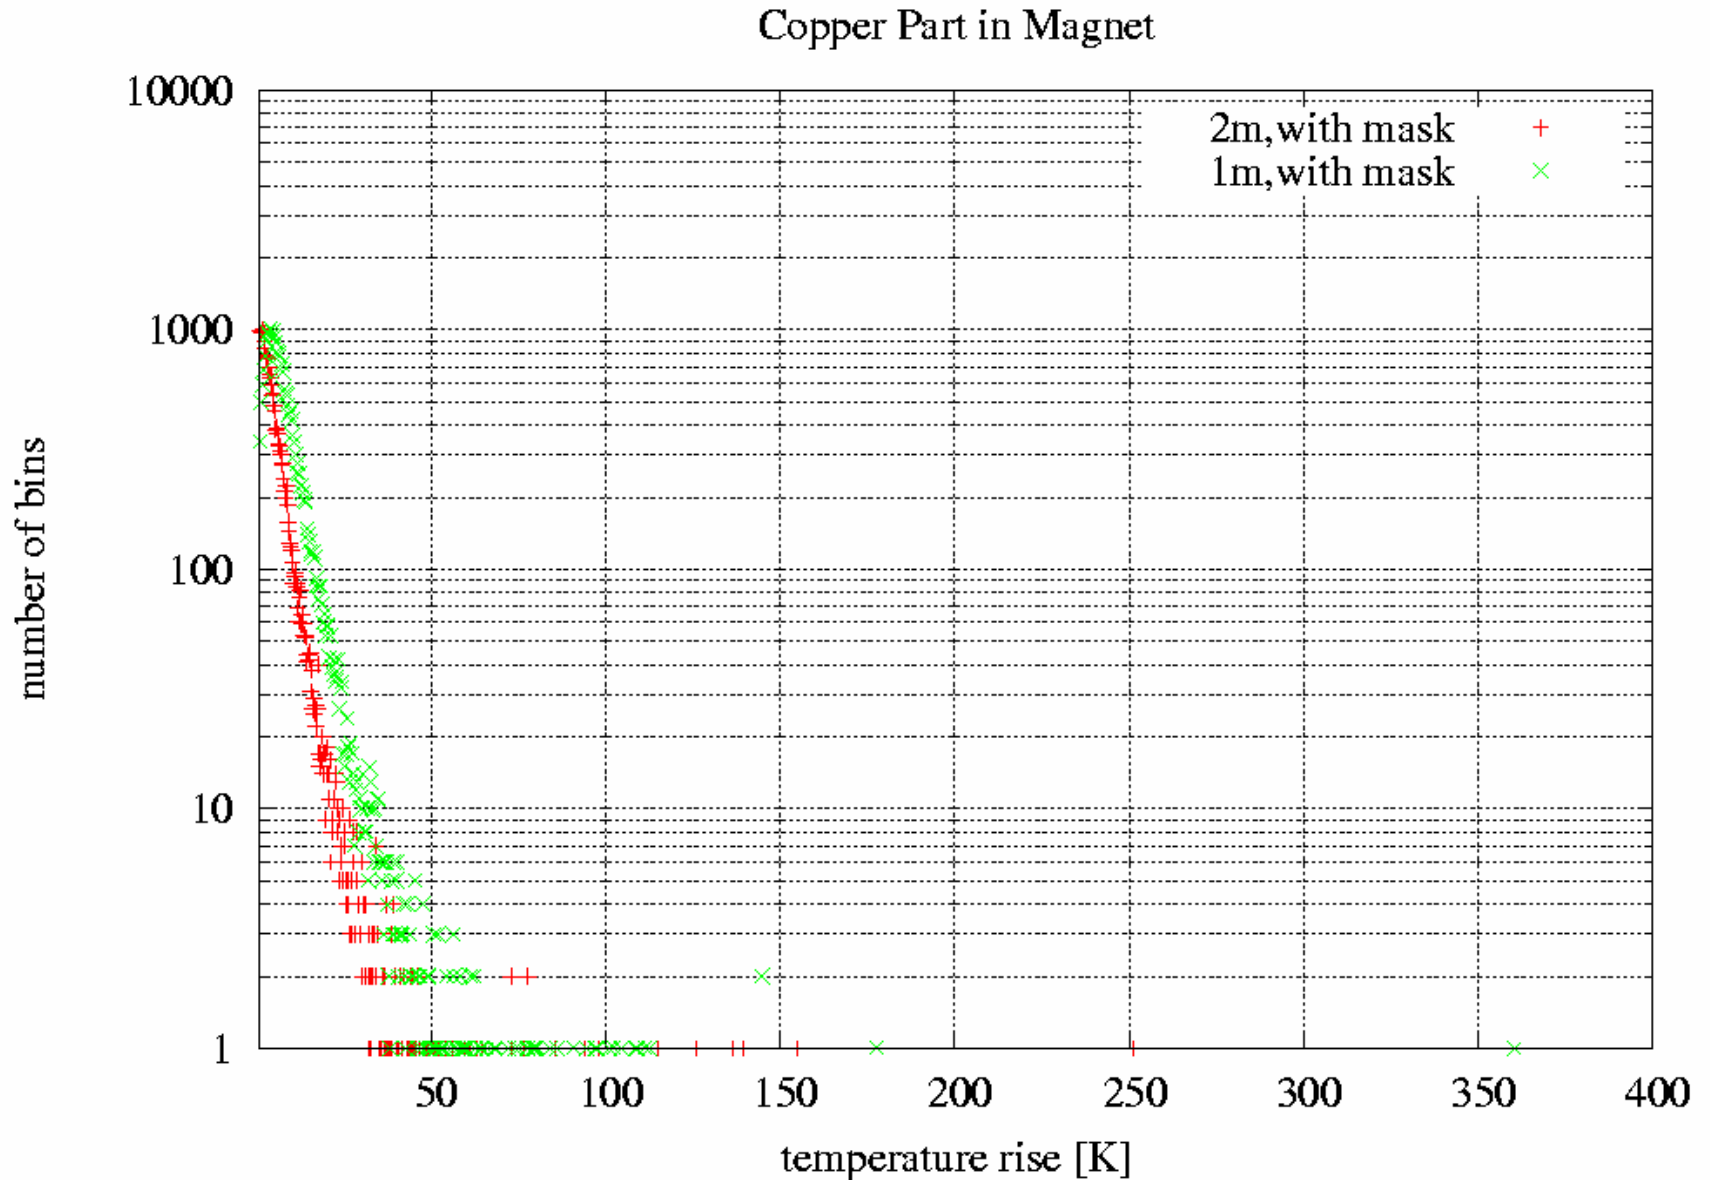

# Mask: 1 $\sigma$ impact, Gaussian beam

Copper part in magnet

# Mask: $1\sigma$ impact, Gaussian beam; Comparison with 1m Jav

# Mask: 1m Jaw, $1\sigma$ impact, Gaussian beam

Temperature Rise in First Flange, Iron, ( $r_2=4.75\text{cm}$ ,  $r_1=3\text{cm}$ )

# Mask: 1m Jaw, $1\sigma$ impact, Gaussian beam

Temperature Rise at Flange in front of Mask, Iron, ( $r_2=4.75\text{cm}$ ,  $r_1=1.45\text{cm}$ )

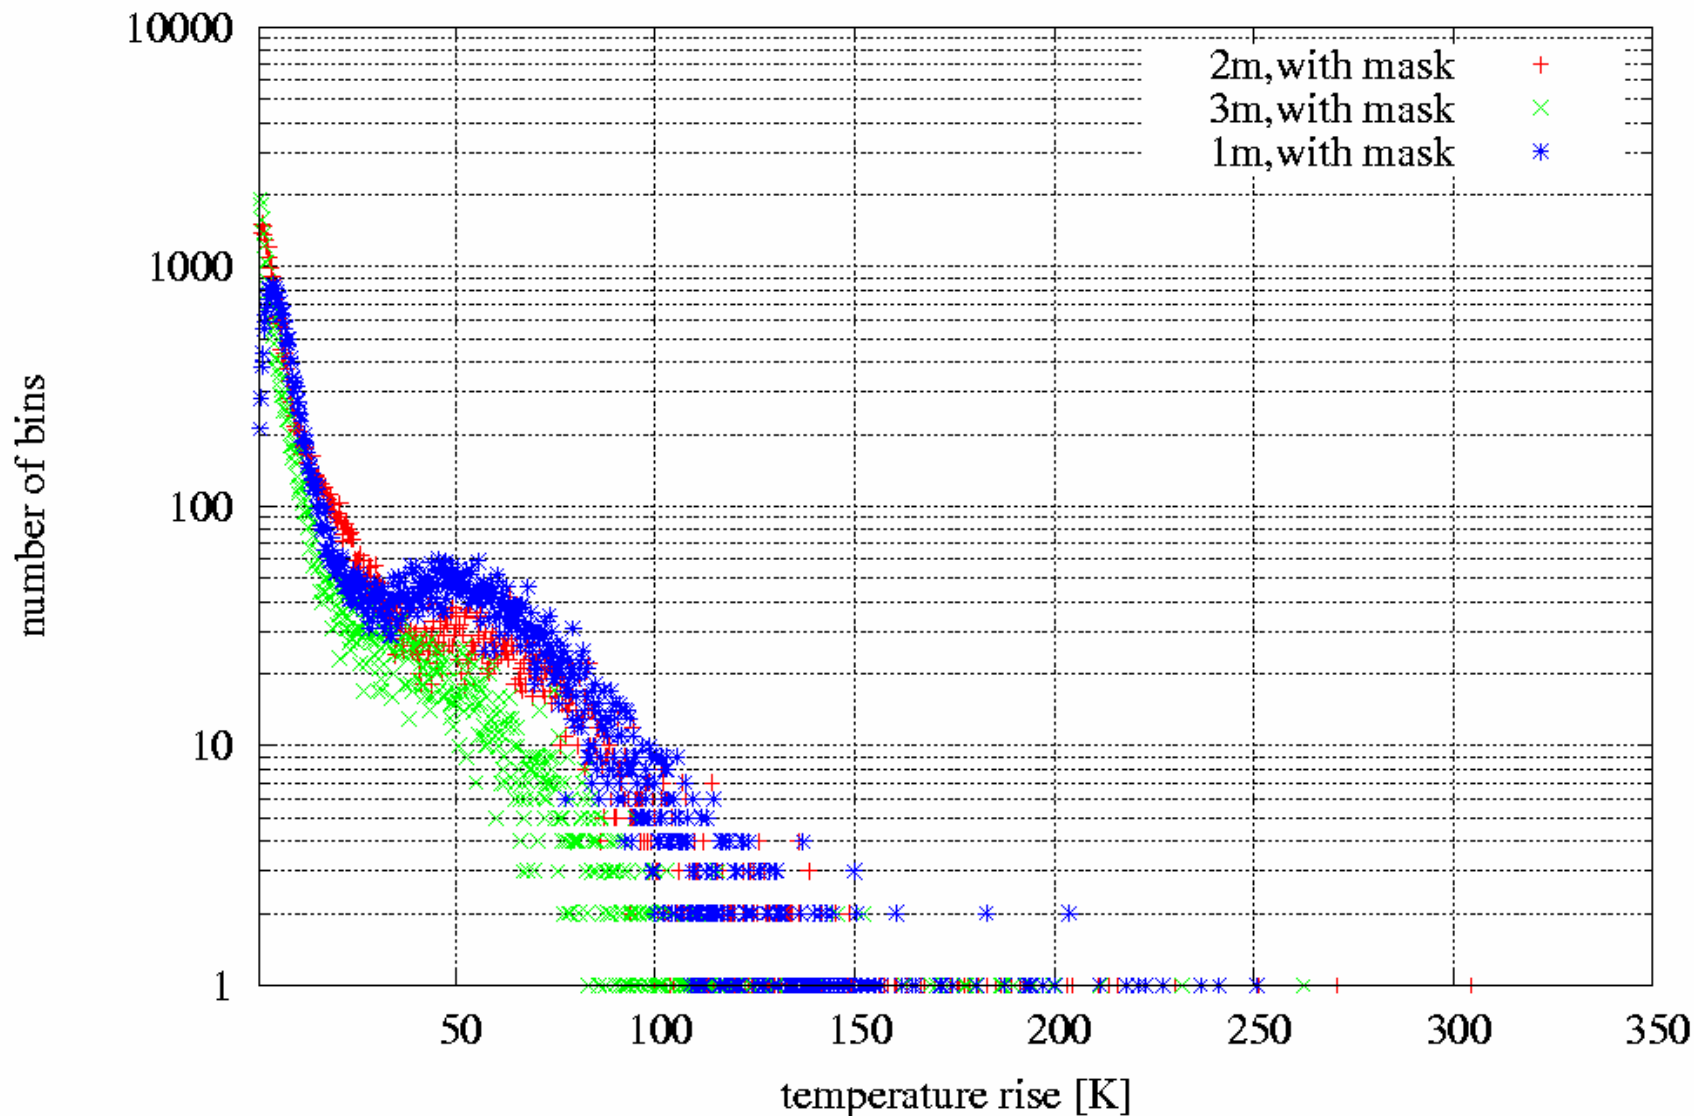

# Mask: 1m Jaw, $1\sigma$ impact, Gaussian beam

Temperature Rise in Mask Iron, ( $r_2=19\text{cm}$ ,  $r_1=1.45\text{cm}$ )

# Mask: $1\sigma$ impact, Gaussian beam

Temperature Rise in Mask

# Numbers...

## Peak Temperature Rise [K]

### 3m Jaw, Gaussian Beam

Impact Par.	flange 1	Cu
1.5 $\sigma$	50	200
1 $\sigma$	50	180
0.5 $\sigma$	40	160
0.25 $\sigma$	35	140
0 $\sigma$	30	110

### Impact parameter: 1.5cm-gap/2

Jaw	flange 1	Cu
2m, pencil	110	140
3m, pencil	35	50
3m, gauss.	50	60

All simulations for impact of 288 bunches, nominal intensity.

### Mask: impact par. 1 $\sigma$ , Gauss. beam

Jaw	fl@mask	mask	Cu
1m	40	145	65
2m	35	135	50
3m	25	115	40

# Conclusion

## **No Mask:**

- Small impact parameters: out-scattering:
  - Flanges, beam pipes: OK for all jaw lengths
  - Cu-part in Magnet:
    - even 3m jaws ( $1\sigma$  impact parameter): peak temperature rise  $\sim 180\text{K}$
    - Impact parameters  $<1\sigma$  less severe
- Big impact parameter:
  - Cu-part in Magnet: OK for 3m jaw
  - first flange: not too short collimator jaws (max. impact parameter to be checked)

## **Mask:**

- out-scattering: solution works
- 3m long jaws not necessary
- Cu-part in Magnet: 1m jaw ( $1\sigma$  impact parameter) : peak temperature rise  $\sim 65\text{K}$
- $\rightarrow$  LHC-type secondary collimators (length: 1.2m)?

## **Concept for TCDI:**

- “Shorter” ( $<2\text{m}$ ) collimator as diluter plus additional shielding to protect the magnet downstream of the collimator
