Software Design L2: Base Concepts of Parallel Programming: A Pragmatic Approach

Wednesday, 14 September 2022 09:00 (1 hour)

This and the following lecture will explain the concepts behind various parallelization methodologies. First, a theoretical introduction to threads, thread-safety and concurrent data access will be given. As the recent C++ standards (starting from C++11) provide build-in support for parallel programming, their most commonly used concurrency features will be shown. Finally, concrete solutions for problems specific to concurrent programming will be discussed.

Summary

Presenter: GHEATA, Andrei (CERN)
