
ATLAS Permits

Sigi Wenig

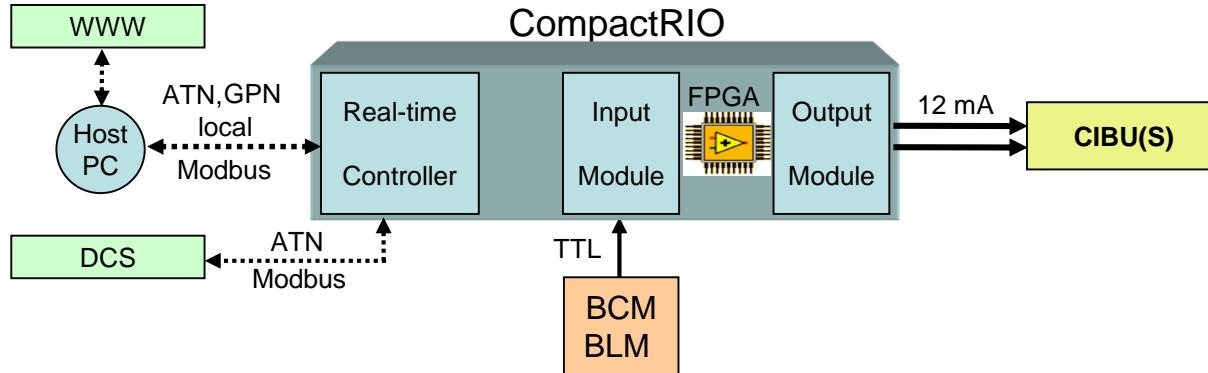

CERN/PH-ATLAS

MPP Meeting 31-July-2009

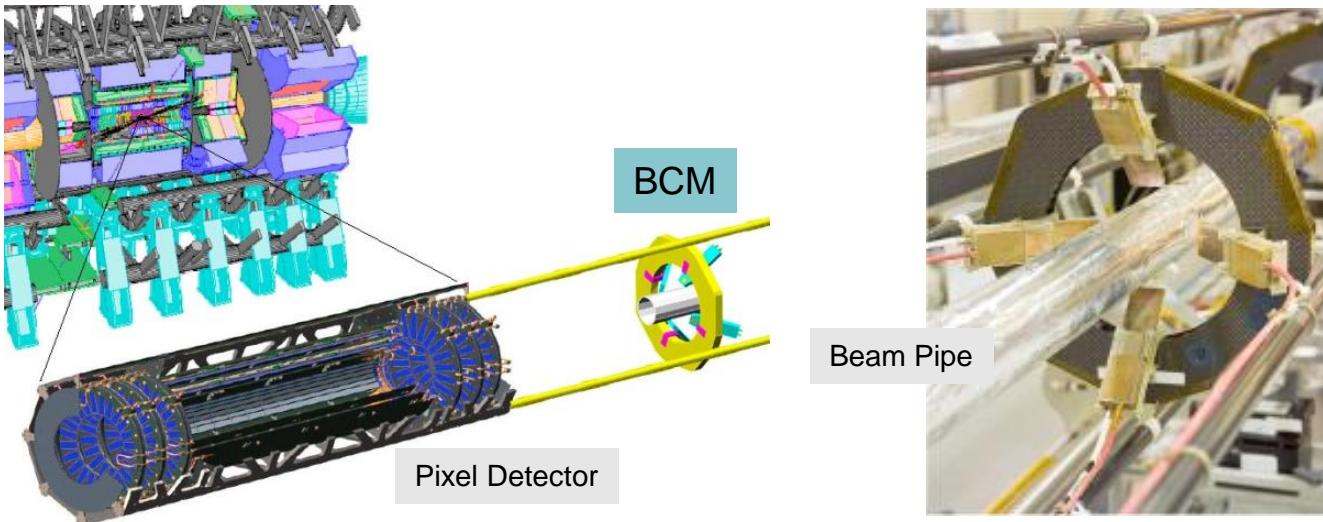

User_Permit and Injection_Permit

- ATLAS delivers 3 inputs (User_Permit) to LHC BIS
 - Detectors
 - Roman Pots (RP)
 - Magnets
- ATLAS delivers 1 input (Injection_Permit) to LHC Injection Permit/Inhibit System
 - Detectors/RP combined
- Systems fulfil requirements defined by LHC
 - Hardware systems
 - UPS power
 - Redundancy
 - Commissioning mode
 - ...

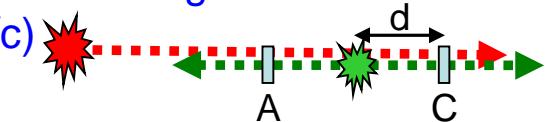

Detector User_Permit

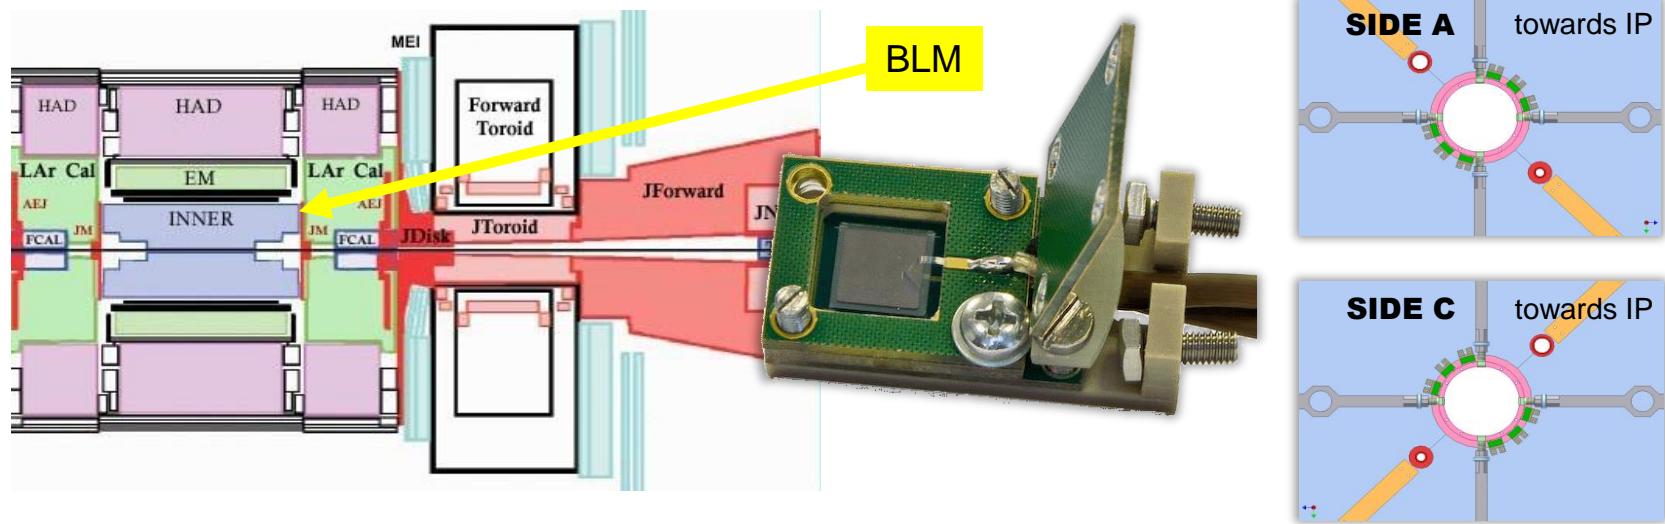

- FPGA based system in RIO technology (NI)
 - Real-time Controller
 - Input/Output Modules
 - CompactRIO bus
- Real-time Controller accessible from
 - ATLAS DCS
 - Host PC
 - WWW
- Delivers signals to LHC Interface CIBU(S)

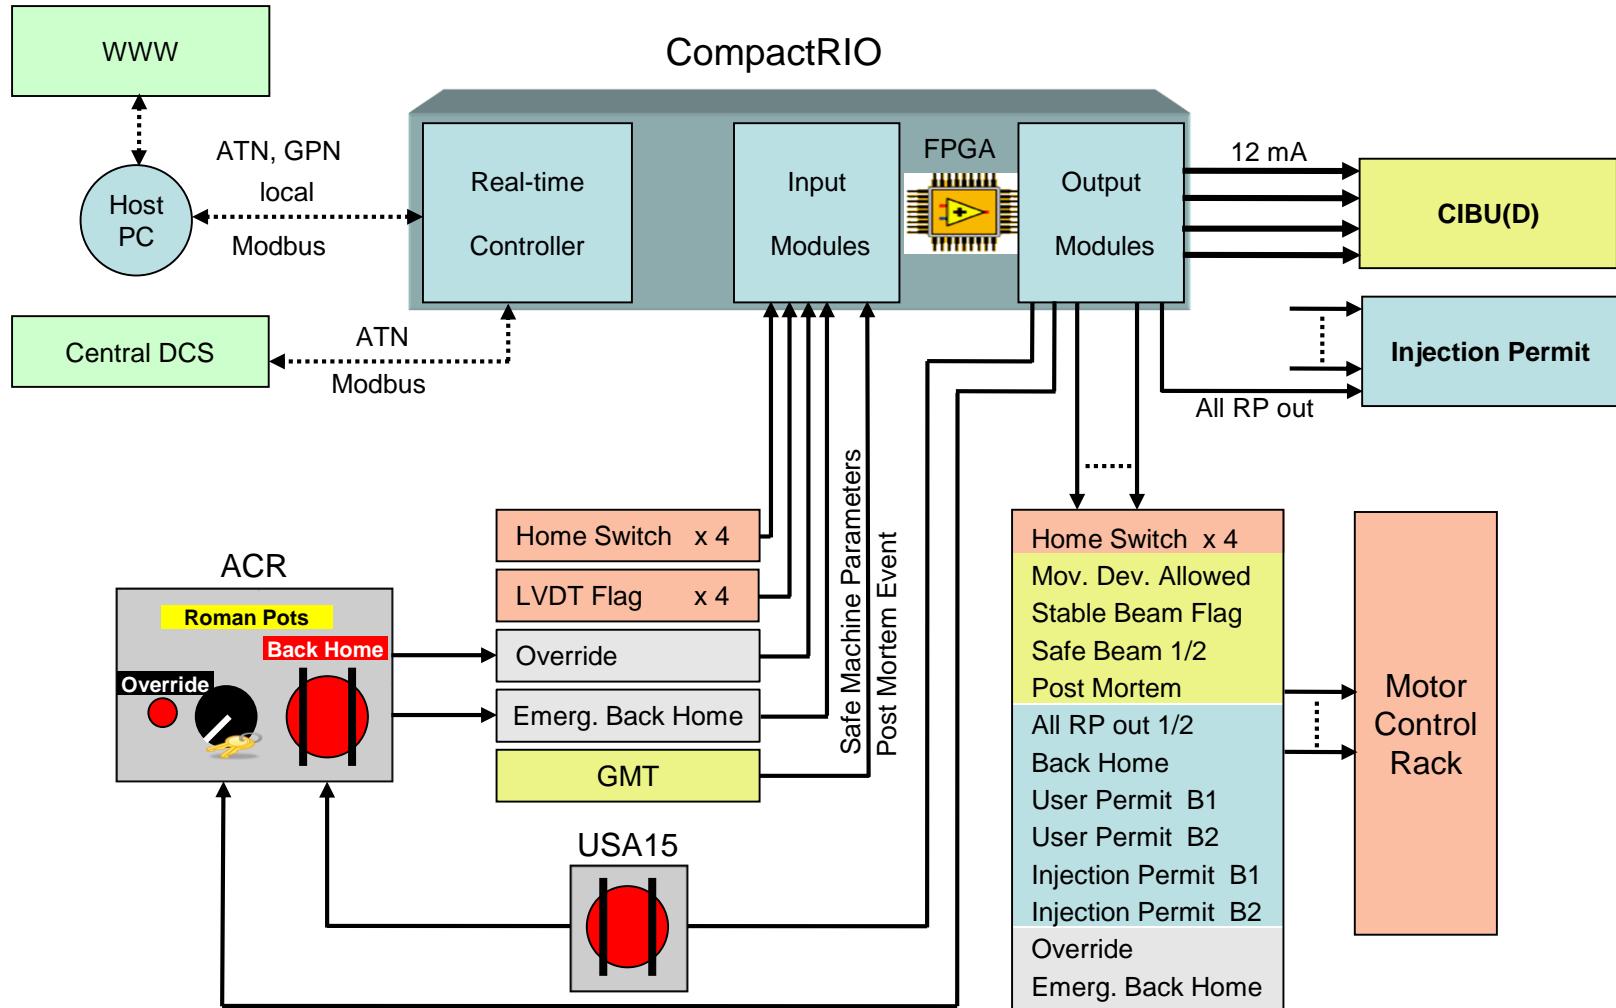

- Beam Condition Monitors (BCM)
 - 2×4 pCVD diamond detectors ($8 \times 8 \text{ mm}^2$)
 - $z = \pm 184 \text{ cm}$ and $r = 55 \text{ mm}$
 - Single MIP sensitivity with sub-ns time resolution → Time of flight measurement
→ distinguish collisions – background ($\Delta T(A/C) = 2d/c$)
- Beam abort condition
 - 3 sensors above high threshold (5 MIPS) AND
 - 4 sensors above low threshold (0.5 MIPS)
- Possibility to develop “dynamic” beam abort algorithm

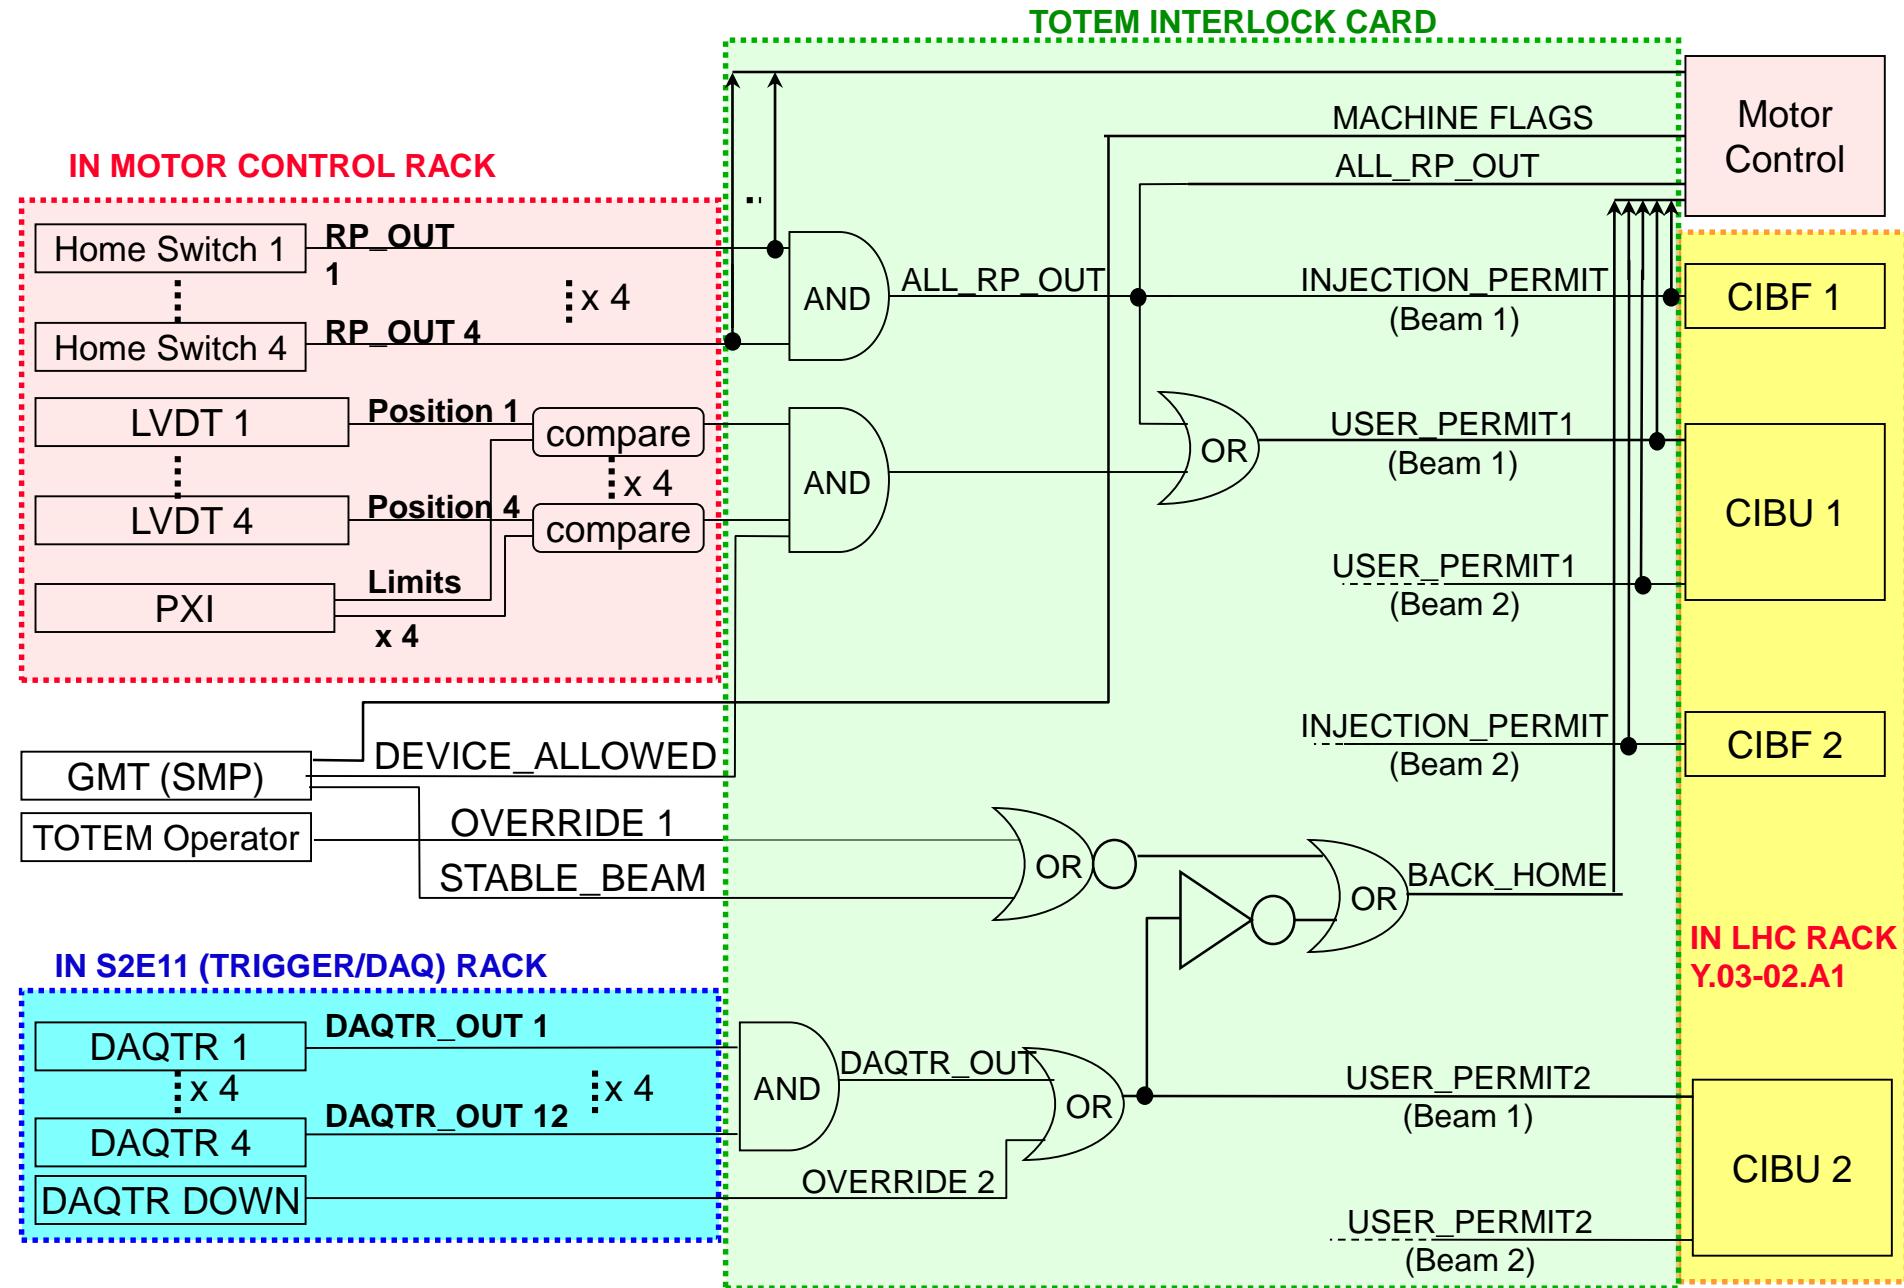

- Beam Loss Monitors (BLMXD.01L1/R1.CH0N_ATLAS)
 - 2 x 6 pCVD diamond detectors ($8 \times 8 \text{ mm}^2$)
 - $z = \pm 345 \text{ cm}$ and $r = 65 \text{ mm}$
 - $40 \mu\text{s}$ integration time
 - Readout chain of LHC BLM system with modified BLMTC FPGA firmware
 - Abort signal at front panel
 - Receive PM signal
- Beam abort condition
 - 2 in a group of 3 detectors above threshold

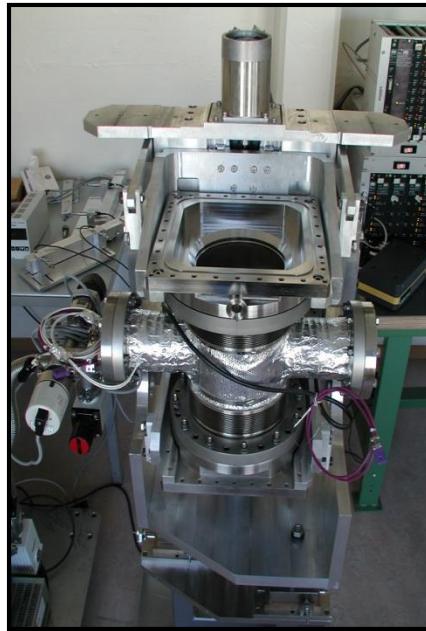

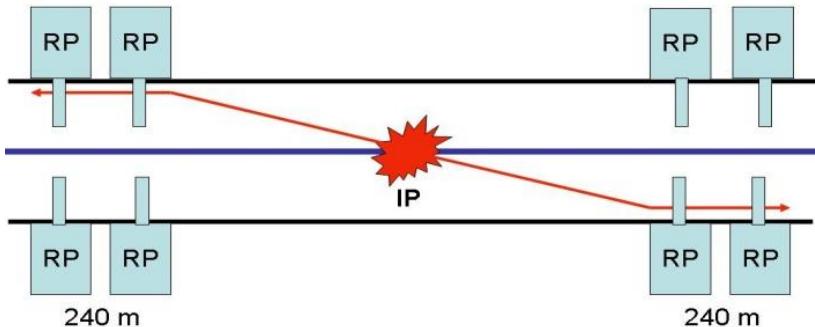

Roman Pot User_Permit

Interlock Block Diagramme – TOTEM MD 11-Jun-09

Roman Pots

Absolute
Luminosity
For
ATLAS

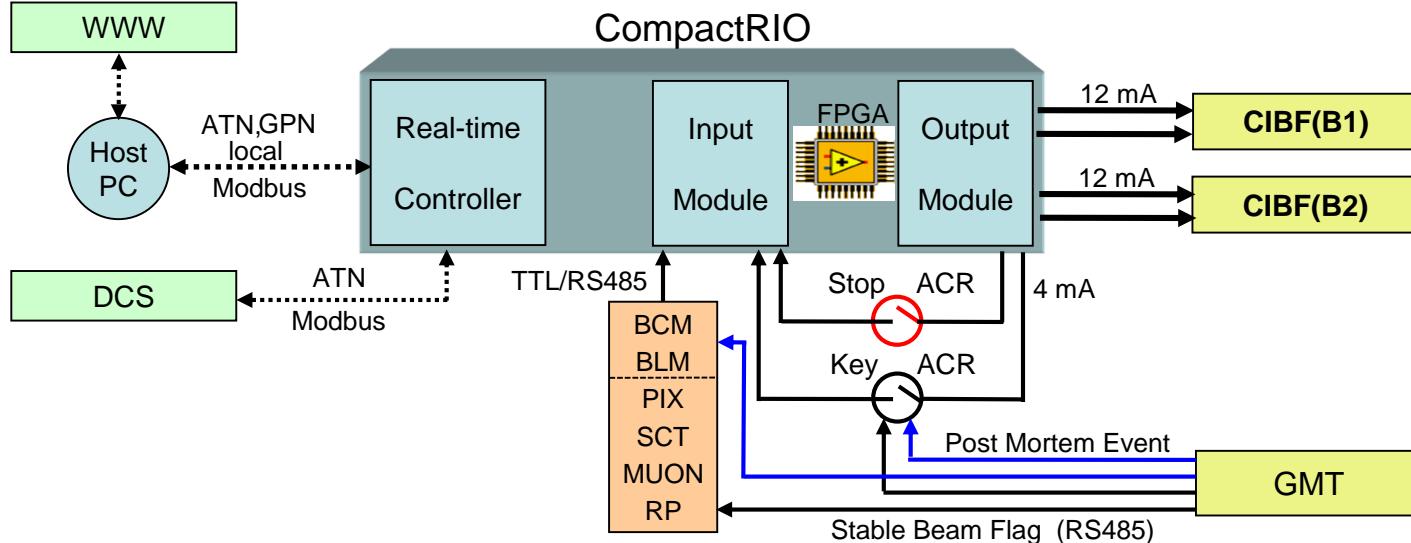

- RP stations are at 240 m from IP
- RP stations will be installed next week
- Detectors (ALFA) will come next year

Magnet User_Permit

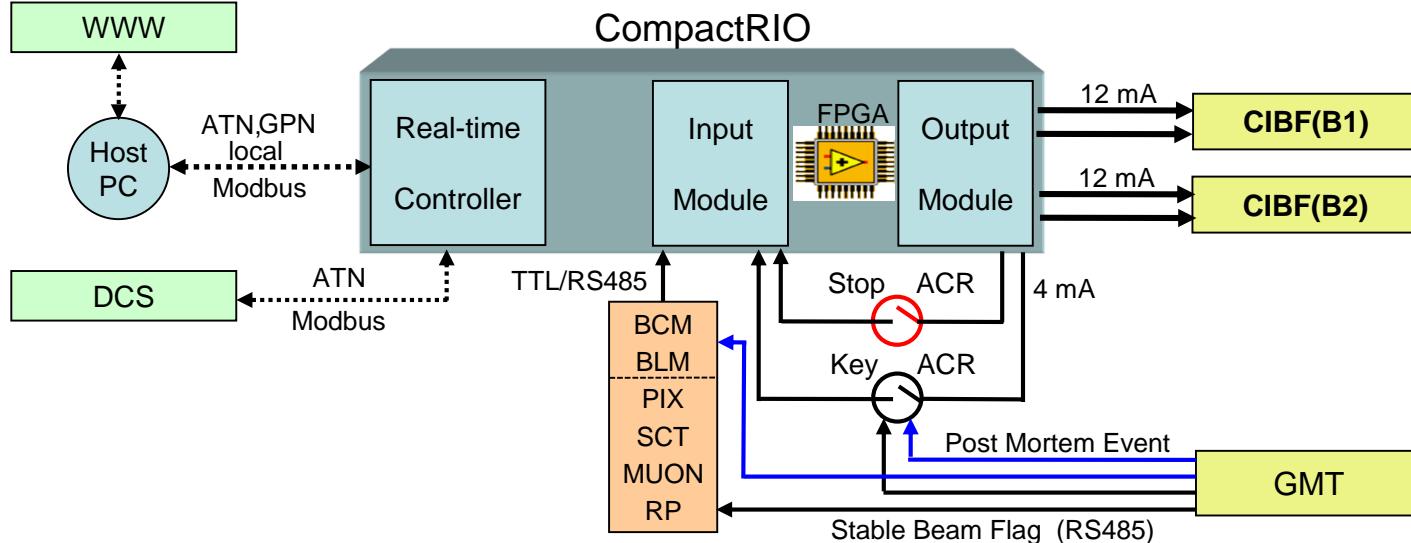

- Taken care of by PH-DT-MSS (L. Deront)
- Hardware installed and operational
- At present permanent User_Permit
 - Possibility to change once influence of ATLAS magnets on beam is fully understood

Injection_Permit (I)

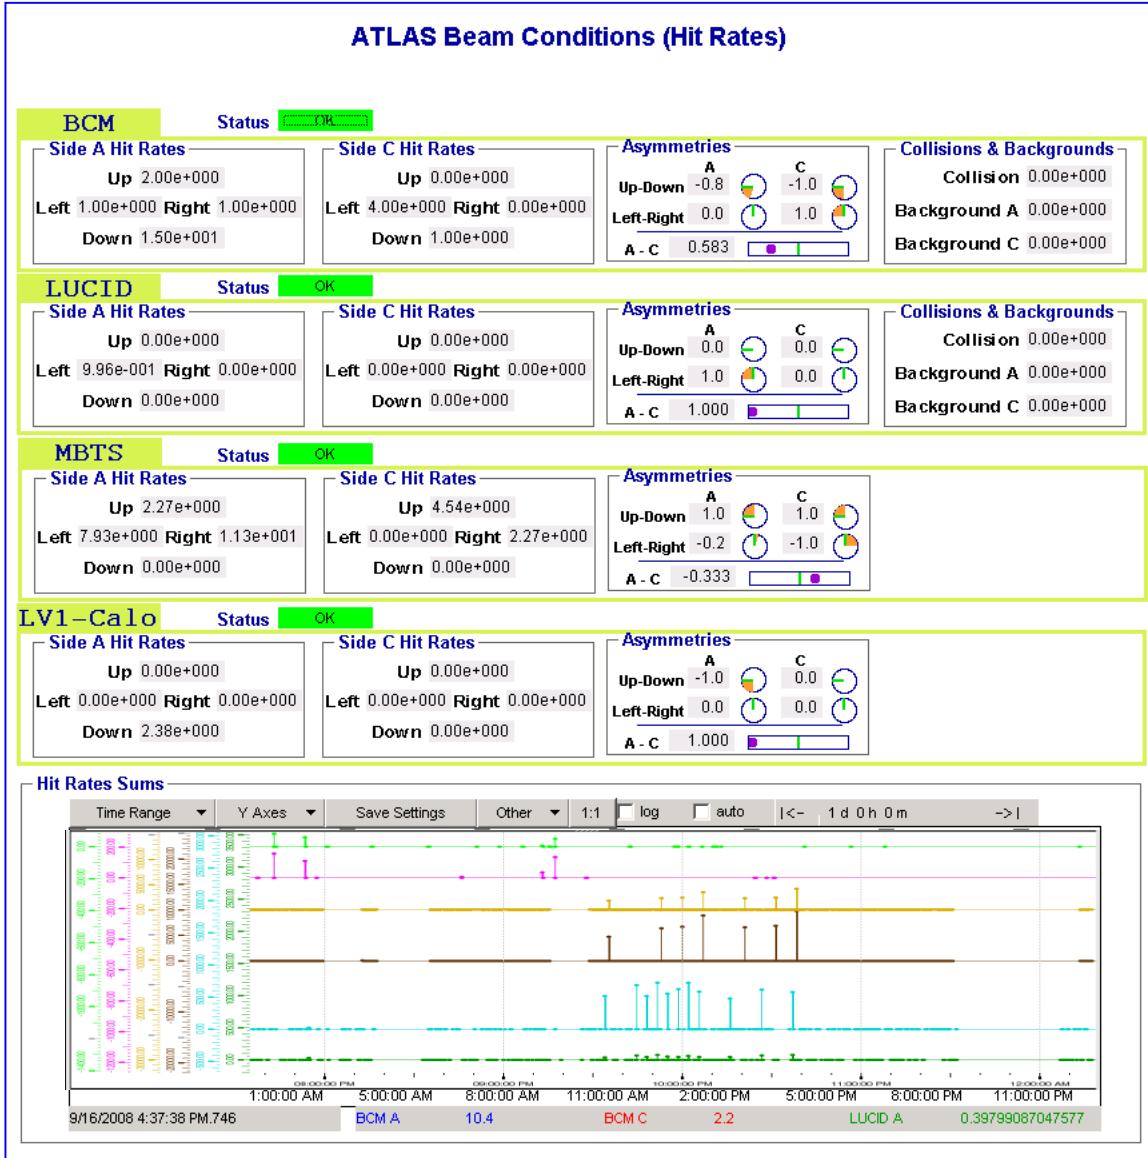

- Injection_Permit is independent of User_Permit
 - Permits injection in empty machine after handshake procedure
 - Allows stopping injection after “bad” injection cycle (without dumping beam)
- Necessary conditions for Injection_Permit
 - BCM and BLM operational
 - Pixel, SCT, Muon on stand-by voltage
 - All Roman Pots out
- Final injection permit given by shift leader in ACR via key (last action of Injection Handshake)

Injection_Permit (II)

- Injection_Permit removed automatically if
 - BCM/BLM not operational
 - Pixel/SCT/Muon on running voltage
 - RP in
 - Stable beam flag “TRUE”
 - Post Mortem Event emitted
- Injection_Permit can be removed manually via emergency button in ACR if “abnormal” beam condition are observed after injection cycle
 - Experience will tell how useful and whether possible to make automatic

Injection_Permit (III) – Beam Conditions

Injection_Permit (IV) – Handshake

LHC - ATLAS Handshake
