

# Hamiltonian truncation for real time dynamics in (gauge) QFT\*

*Wednesday, May 25, 2022 4:00 PM (1 hour)*

Hamiltonian truncation methods represent a powerful toolbox for a set of problems that are otherwise very challenging in strongly coupled quantum field theory: nonequilibrium physics and real time evolution. In many such cases analytical approaches are limited as well as numerical tools like lattice gauge theory and tensor networks. I will talk about recent developments in this field with emphasis to entanglement properties of QFT, connection to ultra cold atomic simulators and exploring new fundamental phenomena.

**Presenter:** KUKULJAN, Ivan (Max Planck Institute for Quantum Optics)
