Average character degree of a finite group

Zeros of Characters

Average number of zeros of characters of a finite group

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト

Irr(G)-set of irreducible characters of G.

 $\chi(1)$ - degree of a character. If $\chi(1) = 1$, then χ is called a

linear character.

 χ is invariant on conjugacy classes.

Irr(G)-set of irreducible characters of G.

 $\chi(1)$ - degree of a character. If $\chi(1) = 1$, then χ is called a

linear character. χ is invariant on conjugacy classes.

Irr(G)-set of irreducible characters of G.

 $\chi(1)$ - degree of a character. If $\chi(1) = 1$, then χ is called a

Fundamental question

Every finite group has an associated character table.

How does the information of a character table of a particular group affect its structure?

Sesuai Yash Madanha(University of Pretoria) Average number of zeros of characters

Average character degree

Definition. Let $T(G) = \sum_{\chi \in Irr(G)} \chi(1)$, k(G) the number of conjugacy classes. Then k(G) = |Irr(G)|. Define the average character degree of *G* by

$$\operatorname{acd}(G) := \frac{T(G)}{|\operatorname{Irr}(G)|}.$$

Examples: $\operatorname{acd}(G) = 1$ when G is abelian, $\operatorname{acd}(A_5) = \frac{16}{5}$, $\operatorname{acd}(A_4) = \frac{3}{2}$.

Average character degree

Definition. Let $T(G) = \sum_{\chi \in Irr(G)} \chi(1)$, k(G) the number of conjugacy classes. Then k(G) = |Irr(G)|. Define the average character degree of *G* by

$$\operatorname{acd}(G) := rac{T(G)}{|\operatorname{Irr}(G)|}.$$

Examples: $\operatorname{acd}(G) = 1$ when G is abelian, $\operatorname{acd}(A_5) = \frac{16}{5}$, $\operatorname{acd}(A_4) = \frac{3}{2}$.

Average character degree

How does the average character degree of a finite group affect its structure?

Theorem.(Magaard and Tong-Viet, 2011) If acd(G) < 2, then G is solvable.

Conjecture 1. (Magaard and Tong-Viet, 2011) If $acd(G) \leq 3$, then *G* is solvable.

Average character degree

How does the average character degree of a finite group affect its structure?

Theorem. (Magaard and Tong-Viet, 2011) If acd(G) < 2, then G is solvable.

Conjecture 1. (Magaard and Tong-Viet, 2011) If $acd(G) \leq 3$, then *G* is solvable.

Average character degree

How does the average character degree of a finite group affect its structure?

Theorem. (Magaard and Tong-Viet, 2011) If acd(G) < 2, then G is solvable.

Conjecture 1. (Magaard and Tong-Viet, 2011) If $acd(G) \leq 3$, then *G* is solvable.

Character Table for A_5

Example. Character Table for A₅

$\chi \setminus \mathcal{C}$	1 <i>A</i>	2 <i>A</i>	3 <i>A</i>	5 <i>A</i>	5 <i>B</i>
χ1	1	1	1	1	1
χ2	3	-1	0	Α	* A
χ3	3	-1	0	* A	Α
χ4	4	0	1	-1	-1
χ5	5	1	-1	0	0

Where
$$A = \frac{(\sqrt{5} + 1)}{2}$$
 and $^{*}A = \frac{(-\sqrt{5} + 1)}{2}$.
From the table, $anz(A_5) = 1$.

Average number of zeros of characters

Theorem. (M, 2021) If anz(G) < 1, then G is solvable. The bound is optimal since $anz(A_5) = 1$.

Proof.

- Reduced the problem to almost simple case.
- If N is a minimal non-abelian normal subgroup of G, then there exists a non-linear character χ ∈ Irr(G) such that χ_N is irreducible and χ vanishes on two conjugacy classes of G.
- (M, 2020) Classification of almost simple groups with an irreducible character that vanishes on one conjugacy class.

Average number of zeros of characters

Theorem. (Moretó, 2022) Classified all non-abelian finite groups such that anz(G) < 1.

Proof.

- Used a different approach to show solvablity of the groups.
- Used the classification in which every non-linear irreducible character vanishes on at most two conjugacy classes. (Chillag, 1999 and Moretó-Sangroniz, 2004).
- only non-solvable groups with property above are A₅ and PSL₂(7).
