# Reverse-wave suppression in ring-resonator lasers

*Tuesday 13 December 2022 16:30 (15 minutes)*

Ring resonators are used to produce injection-seeded, transform-limited pulsed lasers for remote sensing applications. Injection-seeding generally forces uni-directional operation. Our pulsed laser showed both directions were equally seeded. We developed a model that shows <0.1% forward-to-reverse-wave coupling can cause this.
