## **R. Panosso Macedo: Pseudospectrum and quasinormal mode (in)stability**

*Monday 19 December 2022 12:15 (15 minutes)*

Black hole spectroscopy is as a powerful approach to extract space- time information from gravitational wave observed signals. However, quasinormal mode (QNM) spectral instability under high wave- number perturbations has been recently shown to be a common classical general relativistic phenomenon. I will discuss these recent results on the stability of QNM in asymptotically flat black hole spacetimes by means of a pseudospectrum analysis.
