

Beyond Jarlskog: Playing with Flavor Invariants

Based on:

1. Q. Bonnefoy (DESY), E. Gendy (UHH), CG and J. Ruderman (NYU)

arXiv: 2112.03889 *“Beyond Jarlskog: 699 invariants for CP violation in SMEFT”*.

+ follow up paper to appear soon

2. Q. Bonnefoy (DESY), CG, J. Kley (DESY)

to appear later this week: *“The shift-invariant orders of an ALP”*.

Christophe Grojean

DESY (Hamburg) & Humboldt University (Berlin) (christophe.grojean@desy.de)

Outline

The collective nature of **CPV**: Real vs. Imaginary

The (flavour-)invariant measures of CPV

Beyond Jarlskog: the 699 (minimal) CPV invariants of SMEFT₆

Beyond Jarlskog: the 13 invariants of **ALP** shift-symmetry breaking

The collective nature of shift-symmetry breaking

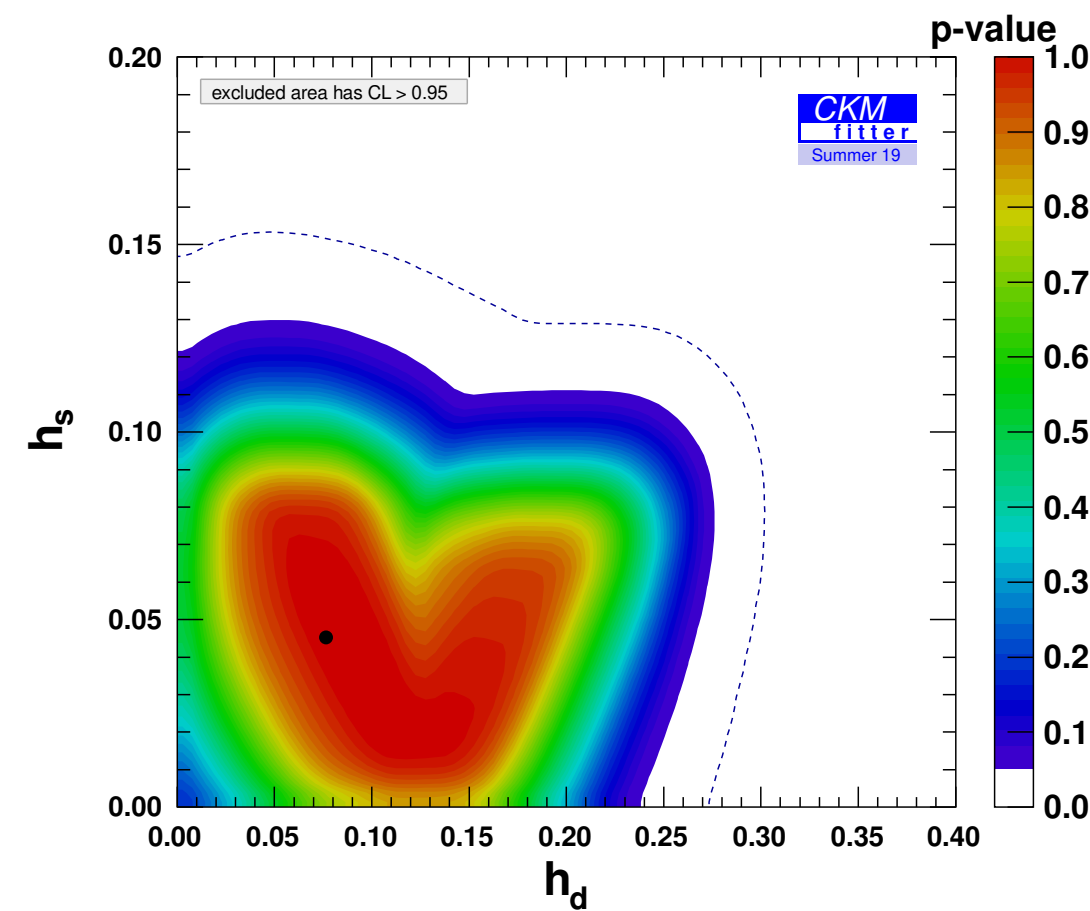

RG invariance of the invariants

Note 1: I'll consider only heavy/decoupling new physics

Note 2: I'll assume that $SU(2) \times U(1)$ is linearly realised above the weak scale, i.e. SMEFT rather than HEFT. Our construction can be generalised but we haven't gone through this exercise (yet). I'll also assume that possible B and L violating effects are pushed to a high scale irrelevant for our discussion.

Does new physics break CP?

- Unlike B & L numbers, CP is not an accidental symmetry of SM₄
- But its violation is “screened” by the CKM selection rules (see next slides)
- BSM CPV effects can be O(1) in most loop-level FCNC processes

$$h e^{2i\sigma} = A_{\text{NP}}(B^0 \rightarrow \bar{B}^0) / A_{\text{SM}}(B^0 \rightarrow \bar{B}^0)$$

\nwarrow NP parameters
 \nearrow

$$\frac{C_{ij}^2}{\Lambda^2} (\bar{q}_{i,L} \gamma_\mu q_{j,L})^2 \quad \longrightarrow \quad h \simeq \frac{|C_{ij}|^2}{|V_{ti}^* V_{tj}|^2} \left(\frac{4.5 \text{ TeV}}{\Lambda} \right)^2$$

Couplings	NP loop order	Sensitivity for Summer 2019 [TeV]		Phase I Sensitivity [TeV]		Phase II Sensitivity [TeV]	
		B_d mixing	B_s mixing	B_d mixing	B_s mixing	B_d mixing	B_s mixing
$ C_{ij} = V_{ti} V_{tj}^* $ (CKM-like)	tree level	9	13	17	18	20	21
	one loop	0.7	1.0	1.3	1.4	1.6	1.7
$ C_{ij} = 1$ (no hierarchy)	tree level	1×10^3	3×10^2	2×10^3	4×10^2	2×10^3	5×10^2
	one loop	80	20	2×10^2	30	2×10^2	40

Charles et al. '20

- On the other hand, there are already strong (indirect) constraints, e.g., EDM
- We need a **map** to explore CPV effects:
 - What are the BSM sources of CPV?
 - What could be their sizes?
 - What should be the structure of CPV to allow new physics still accessible at colliders?

CPV in SM₄

CPV comes from mixing among quarks and the resulting couplings to W

$$\mathcal{L}_{\text{mix}} = \frac{e}{\sqrt{2} \sin \theta_w} \left[W_{\mu}^{+} \bar{u} V \gamma^{\mu} \left(\frac{1 - \gamma_5}{2} \right) d + W_{\mu}^{-} \bar{d} V^{\dagger} \gamma^{\mu} \left(\frac{1 - \gamma_5}{2} \right) u \right]$$

↓ CP

$$\frac{e}{\sqrt{2} \sin \theta_w} \left[W_{\mu}^{+} \bar{u} (V^{\dagger})^T \gamma^{\mu} \left(\frac{1 - \gamma_5}{2} \right) d + W_{\mu}^{-} \bar{d} V^T \gamma^{\mu} \left(\frac{1 - \gamma_5}{2} \right) u \right]$$

Phases in CKM break CP!

Are Phases a Sign of CPV?

Only after exhausting all flavour symmetries!

$$V_{\text{CKM}} = \begin{pmatrix} \frac{72-21i}{325} & \frac{4}{13} & -\frac{12i}{13} \\ -\frac{12}{13} & \frac{576+168i}{1625} & \frac{49-168i}{65} \\ -\frac{96-28i}{325} & -\frac{57}{65} & -\frac{24i}{65} \end{pmatrix}$$

Are Phases a Sign of CPV?

$$J_4 = \text{ImTr} \left([Y_u Y_u^\dagger, Y_d Y_d^\dagger]^3 \right)$$

- Explicitly

$$J_4 = \underbrace{6c_{12}s_{12}c_{13}^2s_{13}c_{23}s_{23}}_{\mathcal{O}(\lambda^6)} \underbrace{(y_c^2 - y_u^2)(y_t^2 - y_u^2)(y_t^2 - y_c^2)(y_s^2 - y_d^2)(y_b^2 - y_d^2)(y_b^2 - y_s^2)}_{\mathcal{O}(\lambda^{30})} \underbrace{\sin \delta}_{\mathcal{O}(\lambda^0)}$$

Wolfenstein parametrisation $V_{\text{CKM}} = \begin{pmatrix} 1 - \lambda^2/2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \lambda^2/2 & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix} + \mathcal{O}(\lambda^4) \quad \lambda \sim 0.22$

- Even if $\delta \sim \mathcal{O}(1)$, large suppression effects due to collective nature of CPV
- Important property: **CP is conserved iff $J_4=0$** (neglecting θ_{QCD} for now)

exercise 1: check that indeed J_4 vanishes on the two examples of previous slide (one need $m_u=m_c$ for the second one!)

exercise 2: check that for $N_F=2$, J_4 always vanishes

BSM CPV is also a Collective Effect

The example of electron EDM

- “Imaginary” Yukawa coupling gives rise to eEDM through Barr-Zee diagram

$$\mathcal{L} = y h \bar{\psi} \psi$$

$$y_u = \frac{\sqrt{2}m_u}{v} \left(1 + C_{uH}v^2/\Lambda^2\right)$$

Brod, Haisch, Zupan '13

$$\frac{d_e}{e} = -\frac{1}{48\pi^2} \frac{vm_em_u}{m_h^2} \frac{\text{Im}(C_{uH})}{\Lambda^2} F_1\left(\frac{m_u^2}{m_h^2}, 0\right)$$

BSM CPV is also a Collective Effect

The example of electron EDM

- “Imaginary” Yukawa coupling gives rise to eEDM through Barr-Zee diagram

$$\mathcal{L} = y h \bar{\psi} \psi$$

$$y_u = \frac{\sqrt{2} m_u}{v} (1 + C_{uH} v^2 / \Lambda^2)$$

Brod, Haisch, Zupan '13

~~$$\frac{d_e}{e} = -\frac{1}{48\pi^2} \frac{v m_e m_u}{m_h^2} \frac{\text{Im}(C_{uH})}{\Lambda^2} F_1\left(\frac{m_u^2}{m_h^2}, 0\right)$$~~

$$\frac{d_e}{e} = -\frac{1}{48\pi^2} \frac{v m_e}{m_h^2} \frac{\text{Im}(m_u^* C_{uH})}{\Lambda^2} F_1\left(\frac{|m_u|^2}{m_h^2}, 0\right)$$

- The Yukawa can be made real by chiral rotation: $\psi \rightarrow e^{i\theta\gamma^5} \psi$
- The “phase” will appear in the mass
- The CPV effect is captured by $\text{Im}(y^\dagger \cdot m)$, which is invariant under chiral rotation

Trivial here, but can get complicated: flavour indices, links to UV parameters...

Dim-6 Yukawa's Contribution to EDMs

CP doesn't say Wilson coefficients are real

$$\mathcal{L} = \underbrace{Y_u}_{\substack{3 \times 3 \text{ complex} \\ (9R+9I)}} \bar{Q} \tilde{H} U + \underbrace{C_{uH}}_{\substack{3 \times 3 \text{ complex} \\ (9R+9I)}} |H|^2 \bar{Q} \tilde{H} U \quad \rightarrow \quad \underbrace{g_{huu}^{ij}}_{Y_u^{ij} + 3v^2 C_{uH}^{ij}} h \bar{u}_i u_j$$

One can choose $U(3)_Q \times U(3)_U$ transformations to make C_{uH} (or g_{huu}) *real*

CPV effects \leftrightarrow **Im C_{uH}**

Phases can be moved to mass matrices — even in mass basis, \exists residual $U(1)$'s to move phase around
(flavour basis fully specified by the location of the phase in the CKM matrix)

Dim-6 Yukawa's Contribution to EDMs

CP doesn't say Wilson coefficients are real

$$\mathcal{L} = \underbrace{Y_u}_{\substack{3 \times 3 \text{ complex} \\ (9R+9I)}} \bar{Q} \tilde{H} U + \underbrace{C_{uH}}_{\substack{3 \times 3 \text{ complex} \\ (9R+9I)}} |H|^2 \bar{Q} \tilde{H} U \quad \rightarrow \quad \underbrace{g_{huu}^{ij}}_{Y_u^{ij} + 3v^2 C_{uH}^{ij}} h \bar{u}_i u_j$$

One can choose $U(3)_Q \times U(3)_U$ transformations to make C_{uH} (or g_{huu}) *real*

CPV effects \leftrightarrow **Im C_{uH}**

Phases can be moved to mass matrices — even in mass basis, \exists residual $U(1)$'s to move phase around
(flavour basis fully specified by the location of the phase in the CKM matrix)

At two loops and $1/\Lambda^2$ order, **Barr-Zee** diagrams depends only on three phases captured by **three invariants**
(only diagonal phases can contribute at 2-loops because no FCNC in SM)

$$\frac{d_e}{e} \propto \frac{\alpha y_e}{16\pi^3} (a I_1 + b I_2 + c I_3)$$

with

$$I_n = \text{Im} \text{Tr} \left(Y_u^\dagger (Y_u Y_u^\dagger)^n C_{uH} \right)$$

a, b, c functions of Y_u only

Dim-6 Yukawa's Contribution to EDMs

CP doesn't say Wilson coefficients are real

$$\mathcal{L} = \underbrace{Y_u}_{\substack{3 \times 3 \text{ complex} \\ (9R+9I)}} \bar{Q} \tilde{H} U + \underbrace{C_{uH}}_{\substack{3 \times 3 \text{ complex} \\ (9R+9I)}} |H|^2 \bar{Q} \tilde{H} U \quad \rightarrow \quad \underbrace{g_{huu}^{ij}}_{Y_u^{ij} + 3v^2 C_{uH}^{ij}} h \bar{u}_i u_j$$

One can choose $U(3)_Q \times U(3)_U$ transformations to make C_{uH} (or g_{huu}) *real*

CPV effects \leftrightarrow **Im C_{uH}**

59 types of operators.
2499 independent Wilson coefficients
(1350 real and 1149 imaginary).

1. How many new sources of CPV?

2. Which ones can appear at BSM leading order ($1/\Lambda^2$)?

— Not because a parameter is $\mathcal{O}(1/\Lambda^2)$ that it can contribute at leading order in any physical observable!

We'll see indeed that there are general non-interference theorems —

3. What are the collective breaking patterns associated to these new sources of CPV?

4. Where should we look for CPV?

Beyond Jarlskog: Building SM₆ invariants

Playing with new fermion bilinear interactions first

- In the Warsaw basis, Manohar et al. counted 7 Hermitian (6R+3I) and 12 generic bilinear (9R+9I) operators for a total of 129 phases (and 150 real parameters)

	5 : $\psi^2 H^3 + \text{h.c.}$	6 : $\psi^2 XH + \text{h.c.}$	$SU(3)_Q$	$SU(3)_u$	$SU(3)_d$	$SU(3)_L$	$SU(3)_e$

	Q_{uH}	$(H^\dagger H)(\bar{q}_p u_r \tilde{H})$	Q_{uG}, Q_{uW}, Q_{uB}	3	$\bar{3}$	1	1	1
	Q_{dH}	$(H^\dagger H)(\bar{q}_p d_r H)$	Q_{dG}, Q_{dW}, Q_{dB}	3	1	$\bar{3}$	1	1
7 : $\psi^2 H^2 D$								
Hermitian matrices	$Q_{Hl}^{(1)}, Q_{Hl}^{(3)}$	$(H^\dagger i \overleftrightarrow{D}_\mu H)(\bar{l}_p \gamma^\mu l_r), (H^\dagger i \overleftrightarrow{D}_\mu^I H)(\bar{l}_p \tau^I \gamma^\mu l_r)$		1	1	1	8 + 1	1
	Q_{He}	$(H^\dagger i \overleftrightarrow{D}_\mu H)(\bar{e}_p \gamma^\mu e_r)$		1	1	1	1	8 + 1
	$Q_{Hq}^{(1)}, Q_{Hq}^{(3)}$	$(H^\dagger i \overleftrightarrow{D}_\mu H)(\bar{q}_p \gamma^\mu q_r), (H^\dagger i \overleftrightarrow{D}_\mu^I H)(\bar{q}_p \tau^I \gamma^\mu q_r)$		8 + 1	1	1	1	1
	Q_{Hu}	$(H^\dagger i \overleftrightarrow{D}_\mu H)(\bar{u}_p \gamma^\mu u_r)$		1	8 + 1	1	1	1
	Q_{Hd}	$(H^\dagger i \overleftrightarrow{D}_\mu H)(\bar{d}_p \gamma^\mu d_r)$		1	1	8 + 1	1	1
generic	Q_{Hud}	$i(\tilde{H}^\dagger D_\mu H)(\bar{u}_p \gamma^\mu d_r)$		1	3	$\bar{3}$	1	1

- In the limit $m_\nu=0$, lepton numbers in each family are conserved. The WC not invariant under these U(1)'s can never show up at linear order in any amplitude: 129 \rightarrow 102 phases (and 150 \rightarrow 123 real parameters) — see later for more details

Beyond Jarlskog: Building SM_6 invariants

Examples of invariants from with bilinear operators

- For each operators, e.g. the dim-6 Yukawa operators, we can build a series of CP-odd invariants:

$$I_{u_1 \dots d_k} = \text{Im} \text{Tr} \left(Y_u^\dagger (Y_u Y_u^\dagger)^{u_1} (Y_d Y_d^\dagger)^{d_1} \dots (Y_u Y_u^\dagger)^{u_k} (Y_d Y_d^\dagger)^{d_k} C_{uH} \right)$$

- Of course, they are not all independent:

e.g., for 3 families,
$$I_3 = \text{Tr} (Y_u Y_u^\dagger) I_2 + \frac{1}{2} \left(\text{Tr} \left((Y_u Y_u^\dagger)^2 \right) - \text{Tr}^2 (Y_u Y_u^\dagger) \right) I_1$$

- Only need to consider only a finite set of invariants:

Cayley-Hamilton:
$$A^3 = A^2 \text{Tr}(A) - \frac{1}{2} A [\text{Tr}(A)^2 - \text{Tr}(A^2)] + \frac{1}{6} [\text{Tr}(A)^3 - 3 \text{Tr}(A^2) \text{Tr}(A) + 2 \text{Tr}(A^3)] \mathbb{I}_{3 \times 3}$$

→ enough to consider
$$\text{Tr} (X_u^a X_d^b X_u^c X_d^d C)$$

$$a, b, c, d = 0, 1, 2, a \neq b, c \neq d$$
 $X_{u/d} = Y_{u/d} Y_{u/d}^\dagger$

Still too many invariants, not all independent from each other

Beyond Jarlskog: Minimal Basis

Transfer matrix of maximal rank

$$\begin{pmatrix} I_1 \\ I_2 \\ \dots \\ I_n \end{pmatrix} = \begin{pmatrix} T^R & T^I \end{pmatrix} \begin{pmatrix} \text{Re}C_1 \\ \text{Re}C_2 \\ \dots \\ \text{Re}C_p \\ \text{Im}C_1 \\ \dots \\ \text{Im}C_q \end{pmatrix}$$

transfer matrix that depends
only on Y_u and Y_d

Beyond Jarlskog: Minimal Basis

Transfer matrix of maximal rank

$$\begin{pmatrix} I_1 \\ I_2 \\ \dots \\ I_n \end{pmatrix} = \begin{pmatrix} T^R & T^I \end{pmatrix} \begin{pmatrix} \text{Re}C_1 \\ \text{Re}C_2 \\ \dots \\ \text{Re}C_p \\ \text{Im}C_1 \\ \dots \\ \text{Im}C_q \end{pmatrix}$$

transfer matrix that depends
only on Y_u and Y_d

The problem boils down to find what is the maximal rank of the transfer matrix
in general and also when $J_4=0$

Beyond Jarlskog: Minimal Basis

Transfer matrix of maximal rank

Seems a simple exercise to compute the rank!

But the invariants are real monsters when computed explicitly in a particular flavour basis

(up to $9^7 \approx 5 \times 10^6$ of terms for some of the invariants)

Hopeless to analytically compute ranks.

Numerically tricky too → compute ranks for rational matrices

Note that there are fewer CP-odd invariants than phases

Not all the phases can appear in observables – not interference theorems

Non-Interference

Conservation of individual family lepton numbers

Let us see it in a fixed basis, e.g.

$$Y_u = \text{diag}(y_u, y_c, y_t) \quad Y_d = V_{\text{CKM}} \text{diag}(y_d, y_s, y_b) \quad Y_e = \text{diag}(y_e, y_\mu, y_\tau)$$

In the lepton sector, this choice breaks the $U(3)_L \times U(3)_e$ of the free Lagrangian down to the $U(1)^3$ described by the transformation

$$(L, e) \rightarrow \text{diag}(e^{i\delta_1}, e^{i\delta_2}, e^{i\delta_3})(L, e)$$

At dimension 6, operators containing leptons are charged under this symmetry, e.g.

$$\mathcal{O}_{He} = \frac{1}{\Lambda^2} C_{He,mn} (H^\dagger i \overleftrightarrow{D}_\mu H) \bar{e}_m \gamma^\mu e_n \quad C_{He,mn} = \begin{pmatrix} c_{11} & c_{12} & c_{13} \\ c_{12}^* & c_{22} & c_{23} \\ c_{13}^* & c_{23}^* & c_{33} \end{pmatrix} \xrightarrow{U(1)^3} \begin{pmatrix} c_{11} & c_{12} e^{i(\delta_2 - \delta_1)} & c_{13} e^{i(\delta_3 - \delta_1)} \\ c_{12}^* e^{-i(\delta_2 - \delta_1)} & c_{22} & c_{23} e^{i(\delta_3 - \delta_2)} \\ c_{13}^* e^{-i(\delta_3 - \delta_1)} & c_{23}^* e^{-i(\delta_3 - \delta_2)} & c_{33} \end{pmatrix}$$

The off-diagonal elements cannot enter into observables at linear order!

C_{Hd}		Same with $C_{HQ}^{(1,3)} \rightarrow Y_d C_{Hd} Y_d^\dagger$

One explicit basis of invariants

$$L_{abcd}(\tilde{C}) \equiv \text{Im Tr}(X_u^a X_d^b X_u^c X_d^d \tilde{C})$$

Minimal vs Maximal Basis

Transfer matrix of maximal rank: interference with CKM phase

- If $J_4=0$, we can find 102 independent invariants \Rightarrow **minimal** basis of invariants.

“CP is conserved iff J_4 and the invariants of a minimal basis are all vanishing”

- If $J_4 \neq 0$, we can actually build more independent invariants! Not surprising, because CP-even BSM can interfere with CP-odd SM. But what was maybe unexpected is that we can build more than 102 (independent) invariants that are larger than $J_4 \rightarrow$ **maximal** basis of invariants.

dim (maximal basis) = number of physical (real and imaginary) parameters
that can interfere with SM
and thus can show up in observables at leading $O(1/\Lambda^2)$

Scaling of Collective CPV BSM Effects

The new invariants don't suffer from the same suppression factors

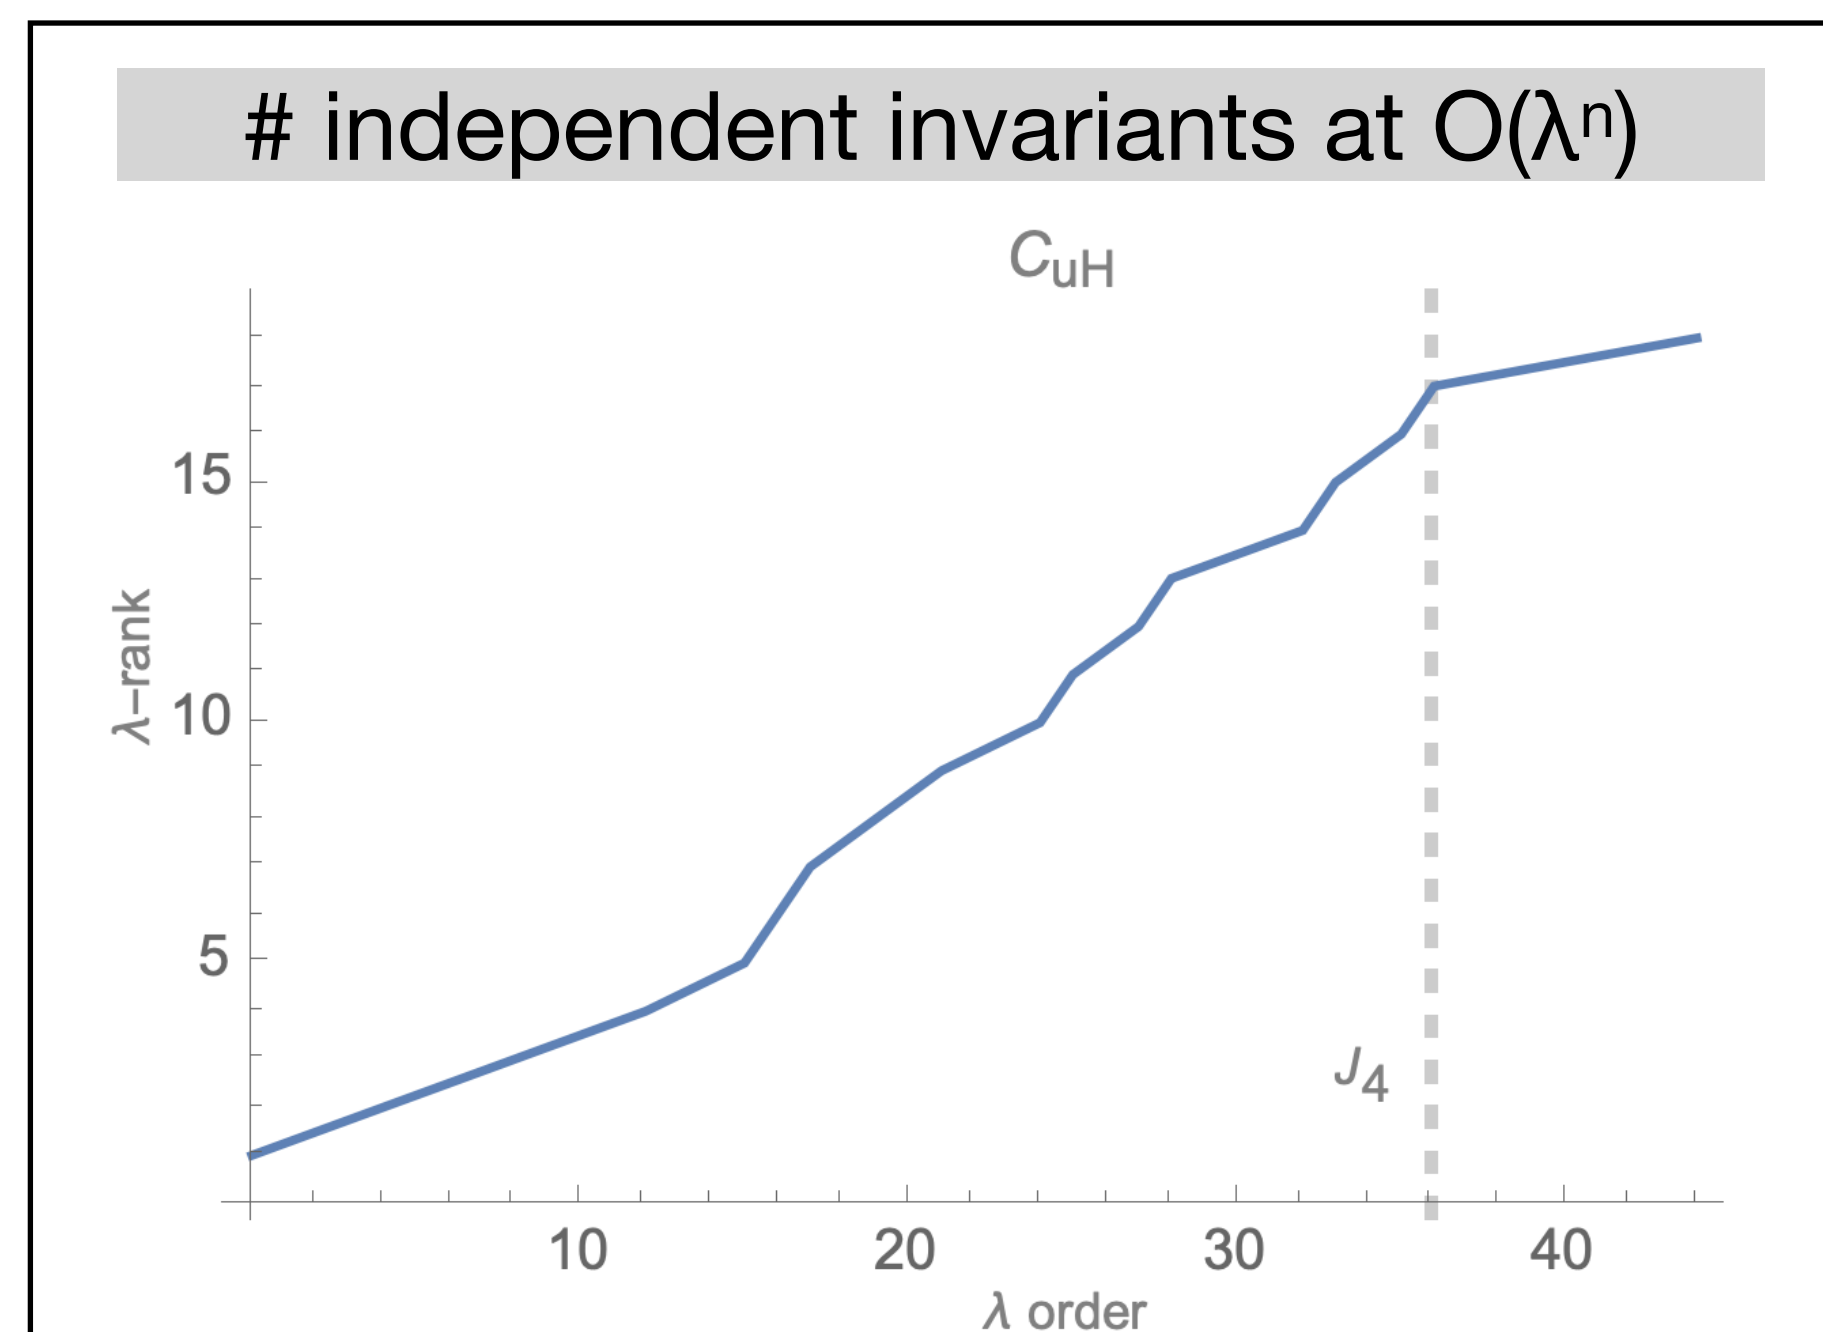

- The invariants can be evaluated in e.g. the up-flavour basis:

$$\begin{aligned}
 \odot \quad I_n &= \underbrace{y_u^{2n+1}}_{\mathcal{O}(\lambda^{16n+8})} \eta_u + \underbrace{y_c^{2n+1}}_{\mathcal{O}(\lambda^{8n+4})} \eta_c + \underbrace{y_t^{2n+1}}_{\mathcal{O}(\lambda^0)} \eta_t & I_n &= \text{Im Tr} \left(Y_u^\dagger (Y_u Y_u^\dagger)^n C_{uH} \right) \\
 \odot \quad I_{1,1} &= \underbrace{c_{13} c_{23} s_{13} s_\delta}_{\mathcal{O}(\lambda^3)} \underbrace{(y_b^2 - c_{12}^2 y_d^2 - s_{12}^2 y_s^2)}_{\mathcal{O}(\lambda^6)} y_t \rho_{ut} + \dots & I_{1,1} &= \text{Im Tr} \left(Y_u^\dagger (Y_u Y_u^\dagger) (Y_d Y_d^\dagger) C_{uH} \right)
 \end{aligned}$$

dim.6
up-Yukawa
operator

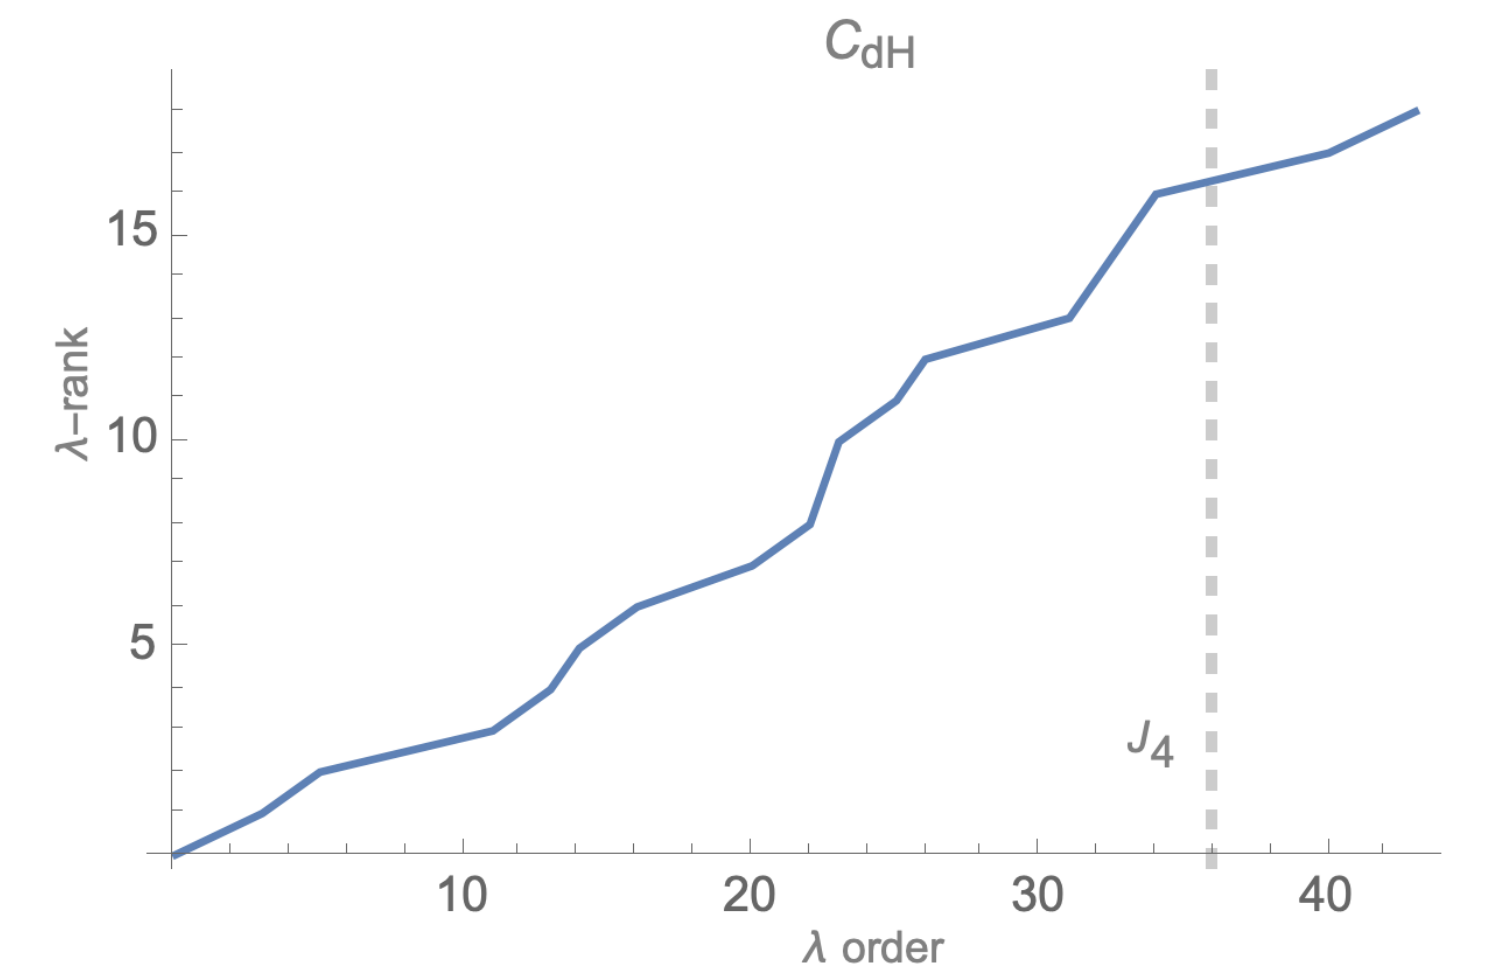

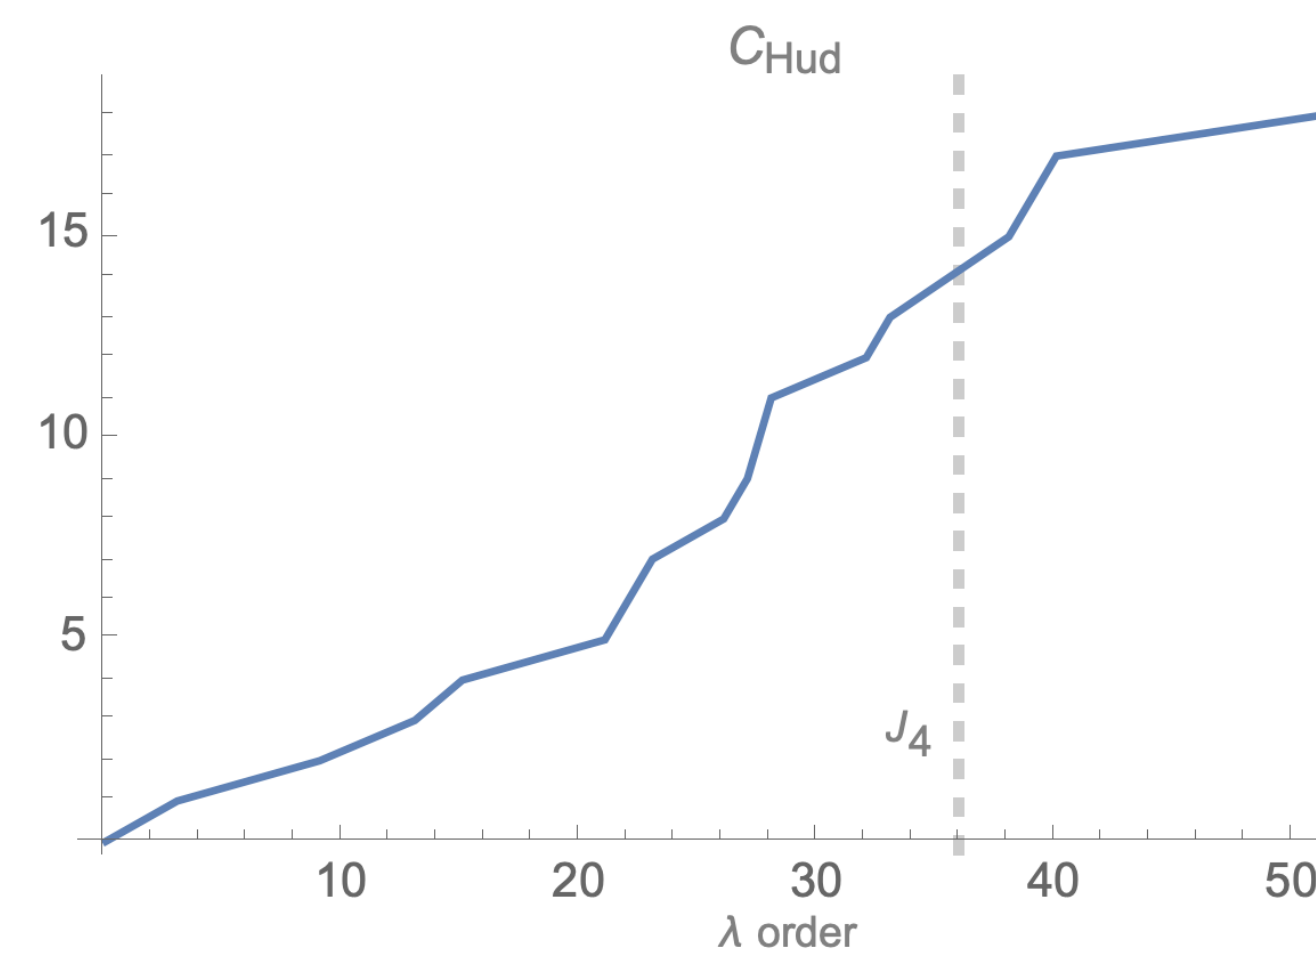

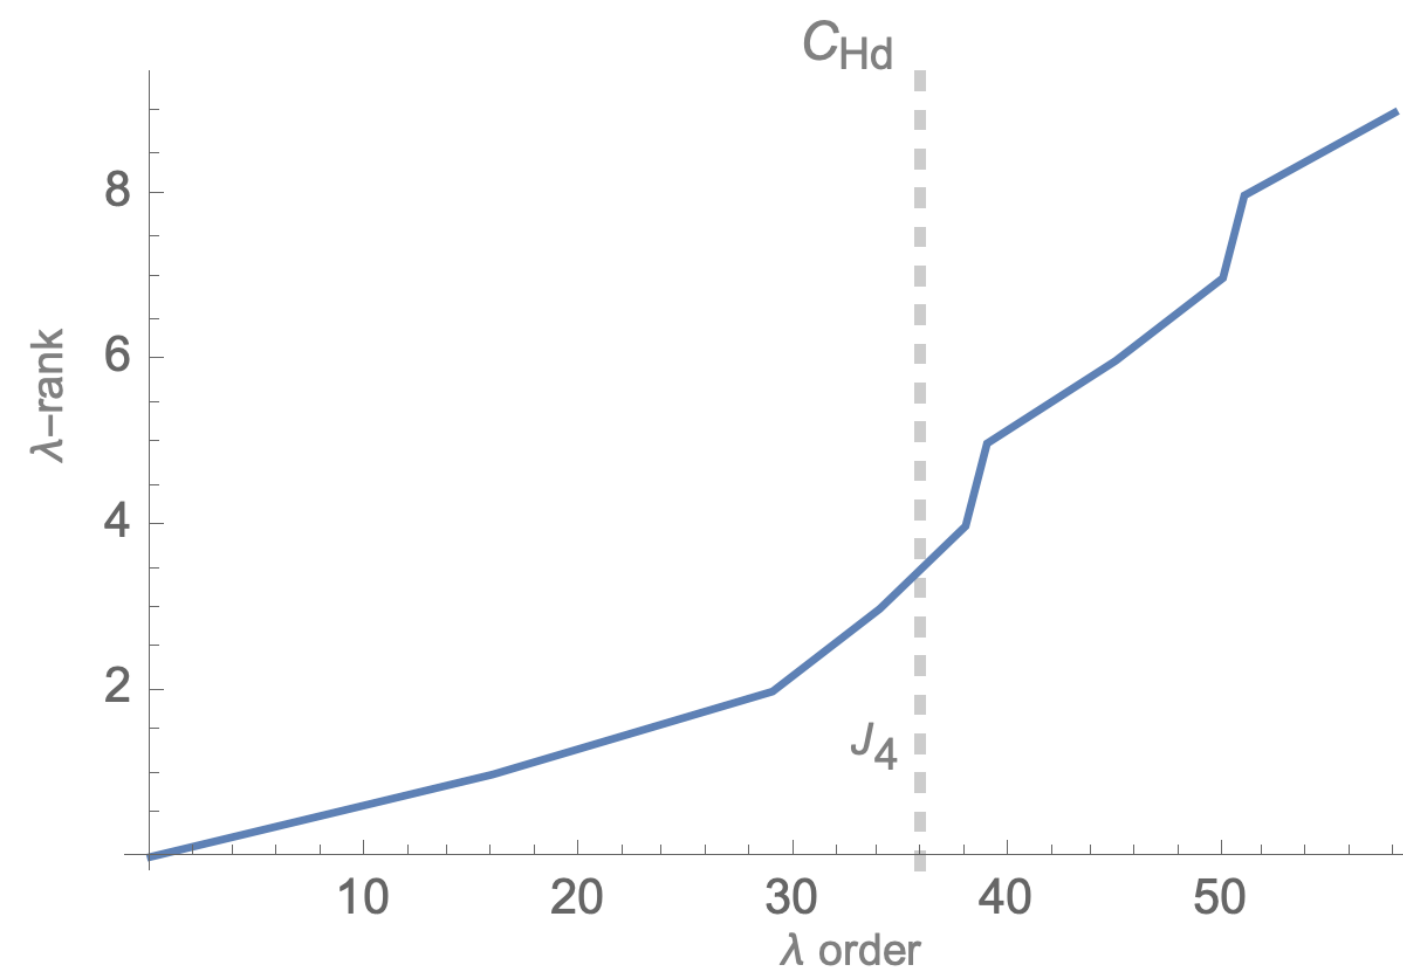

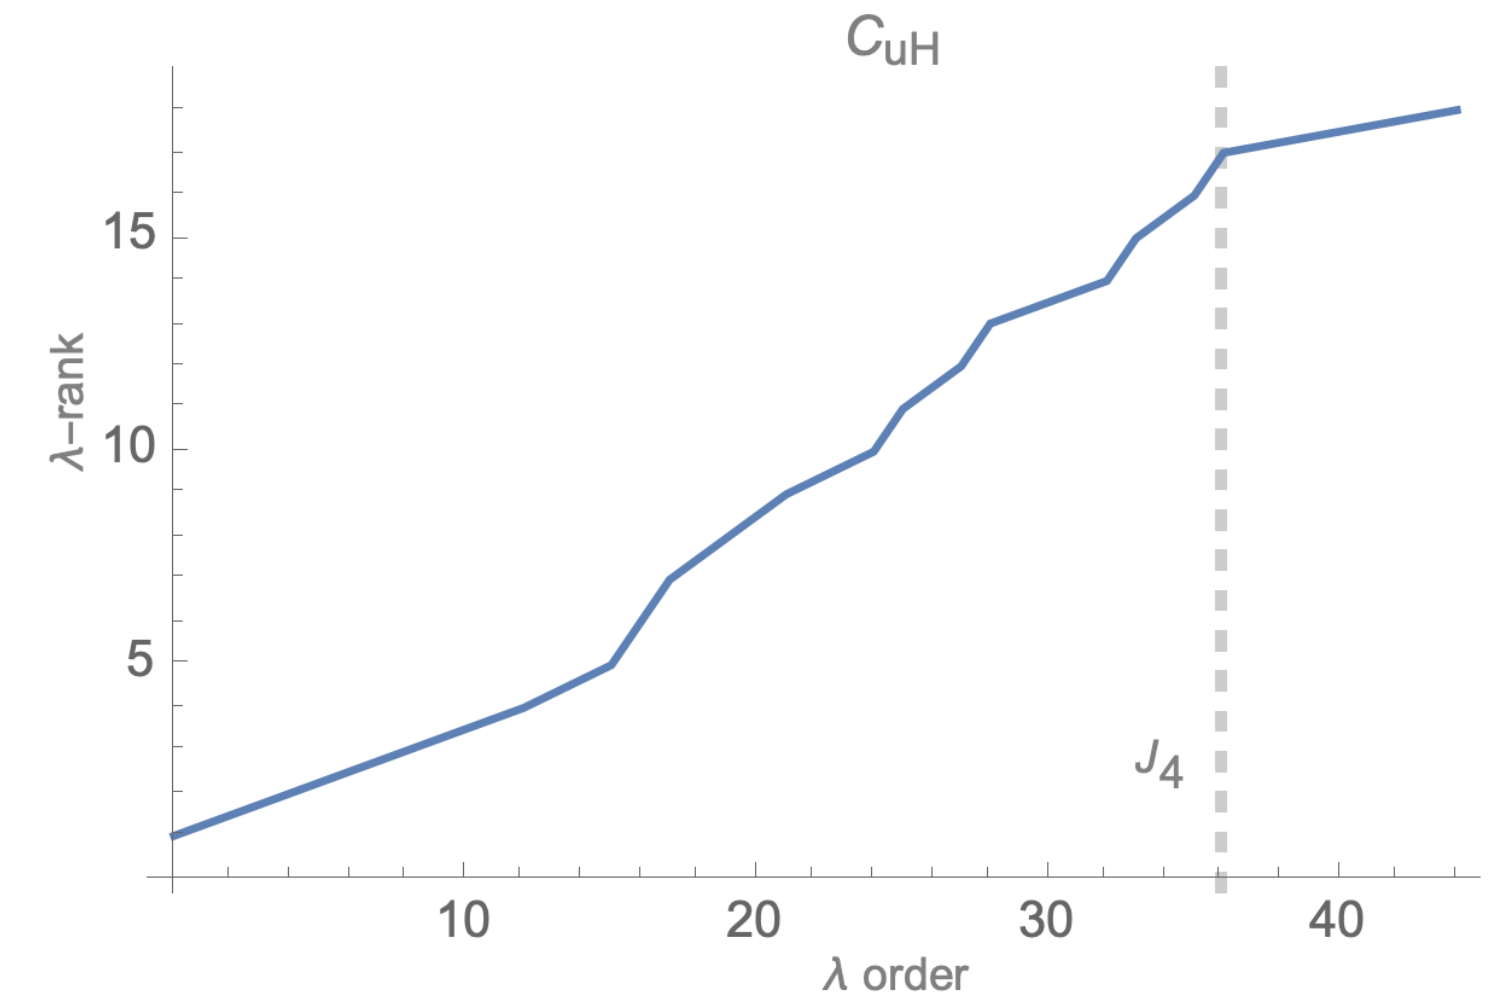

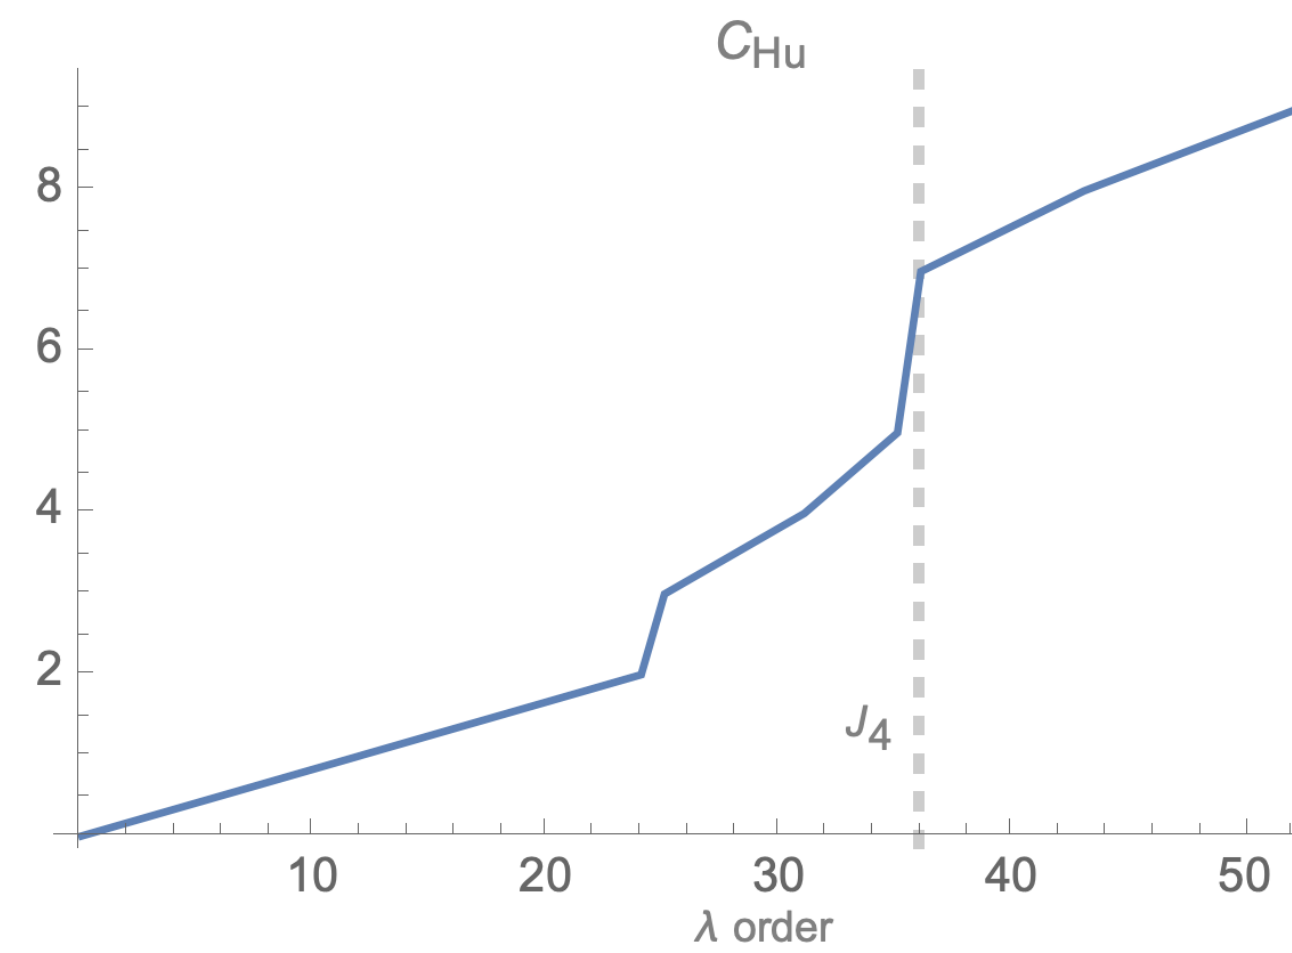

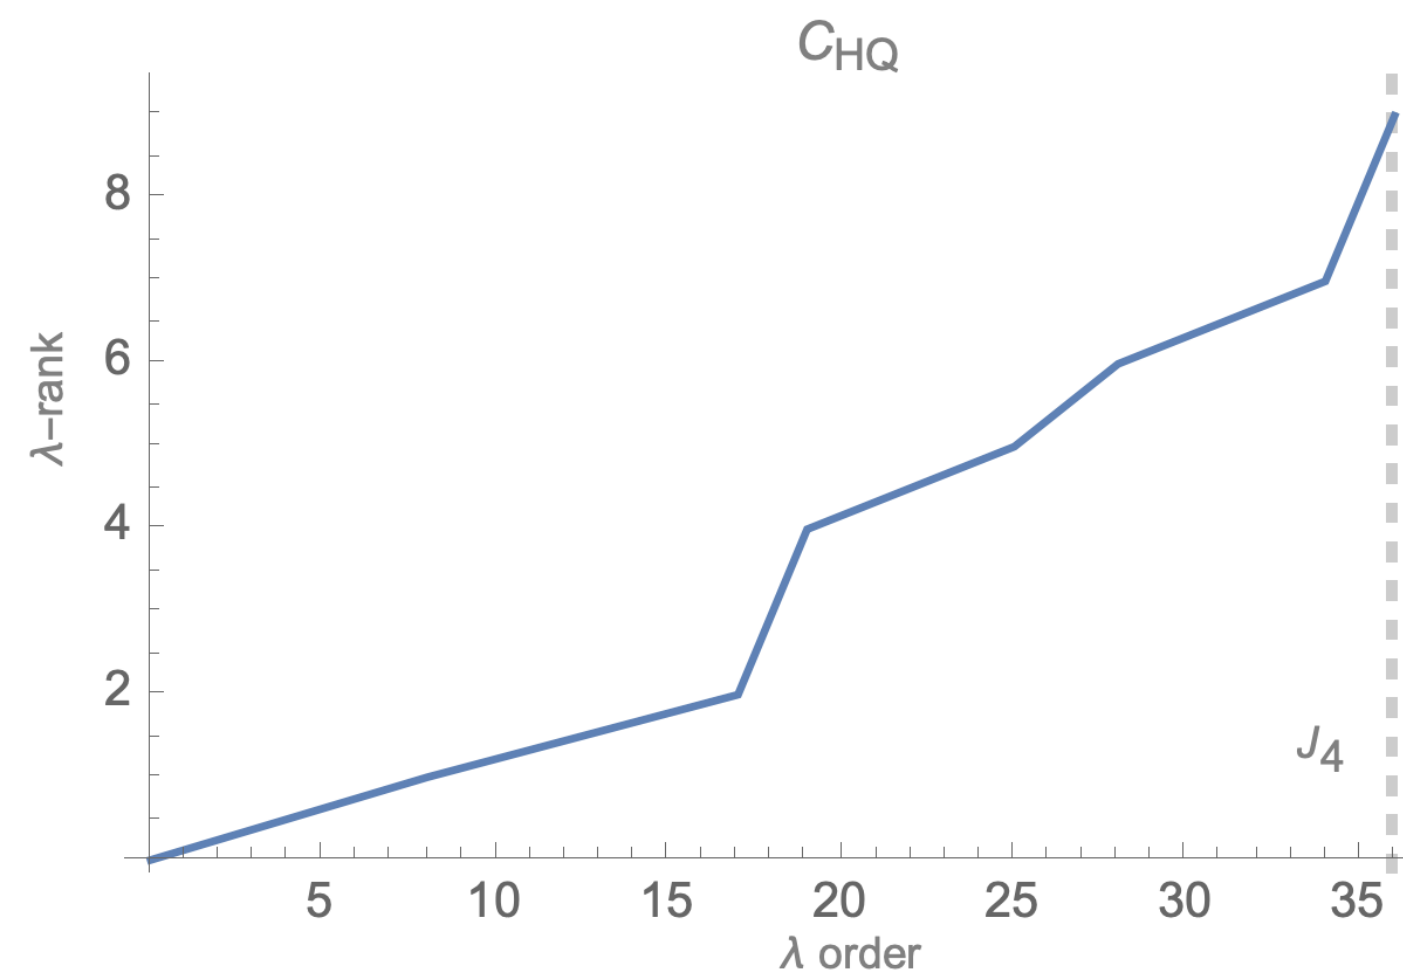

16 independent invariants larger than J_4

$\Lambda \sim 10 \text{ TeV} \rightarrow 14$ invariants larger than J_4
 $\Lambda \sim 1000 \text{ TeV} \rightarrow 10$ invariants larger than J_4

Scaling of Collective CPV BSM Effects

independent invariants at $O(\lambda^n)$ for the quark bilinear operators

Models of Flavours

MFV, first

- Other constraints from CP-even observables: totally flavour generic/anarchic dim-6 operators are severely constrained. How additional flavour structure will affect the orders of CPV computed above in the generic case?
- Let's first stick to the canonical flavour "model": Minimal Flavour Violation

$$c_{uH} = aY_u + b(Y_u Y_u^\dagger) Y_u + c(Y_d Y_d^\dagger) Y_u + \dots$$

Generic Flavour

Rank 1 $\rightarrow \mathcal{O}(\lambda^0)$

Rank 2 $\rightarrow \mathcal{O}(\lambda^4)$

Rank 3 $\rightarrow \mathcal{O}(\lambda^8)$

MFV

Rank 1 $\rightarrow \mathcal{O}(\lambda^0)$

Rank 2 $\rightarrow \mathcal{O}(\lambda^8)$

Rank 3 $\rightarrow \mathcal{O}(\lambda^{18})$

CPV Orders in Alignment Models

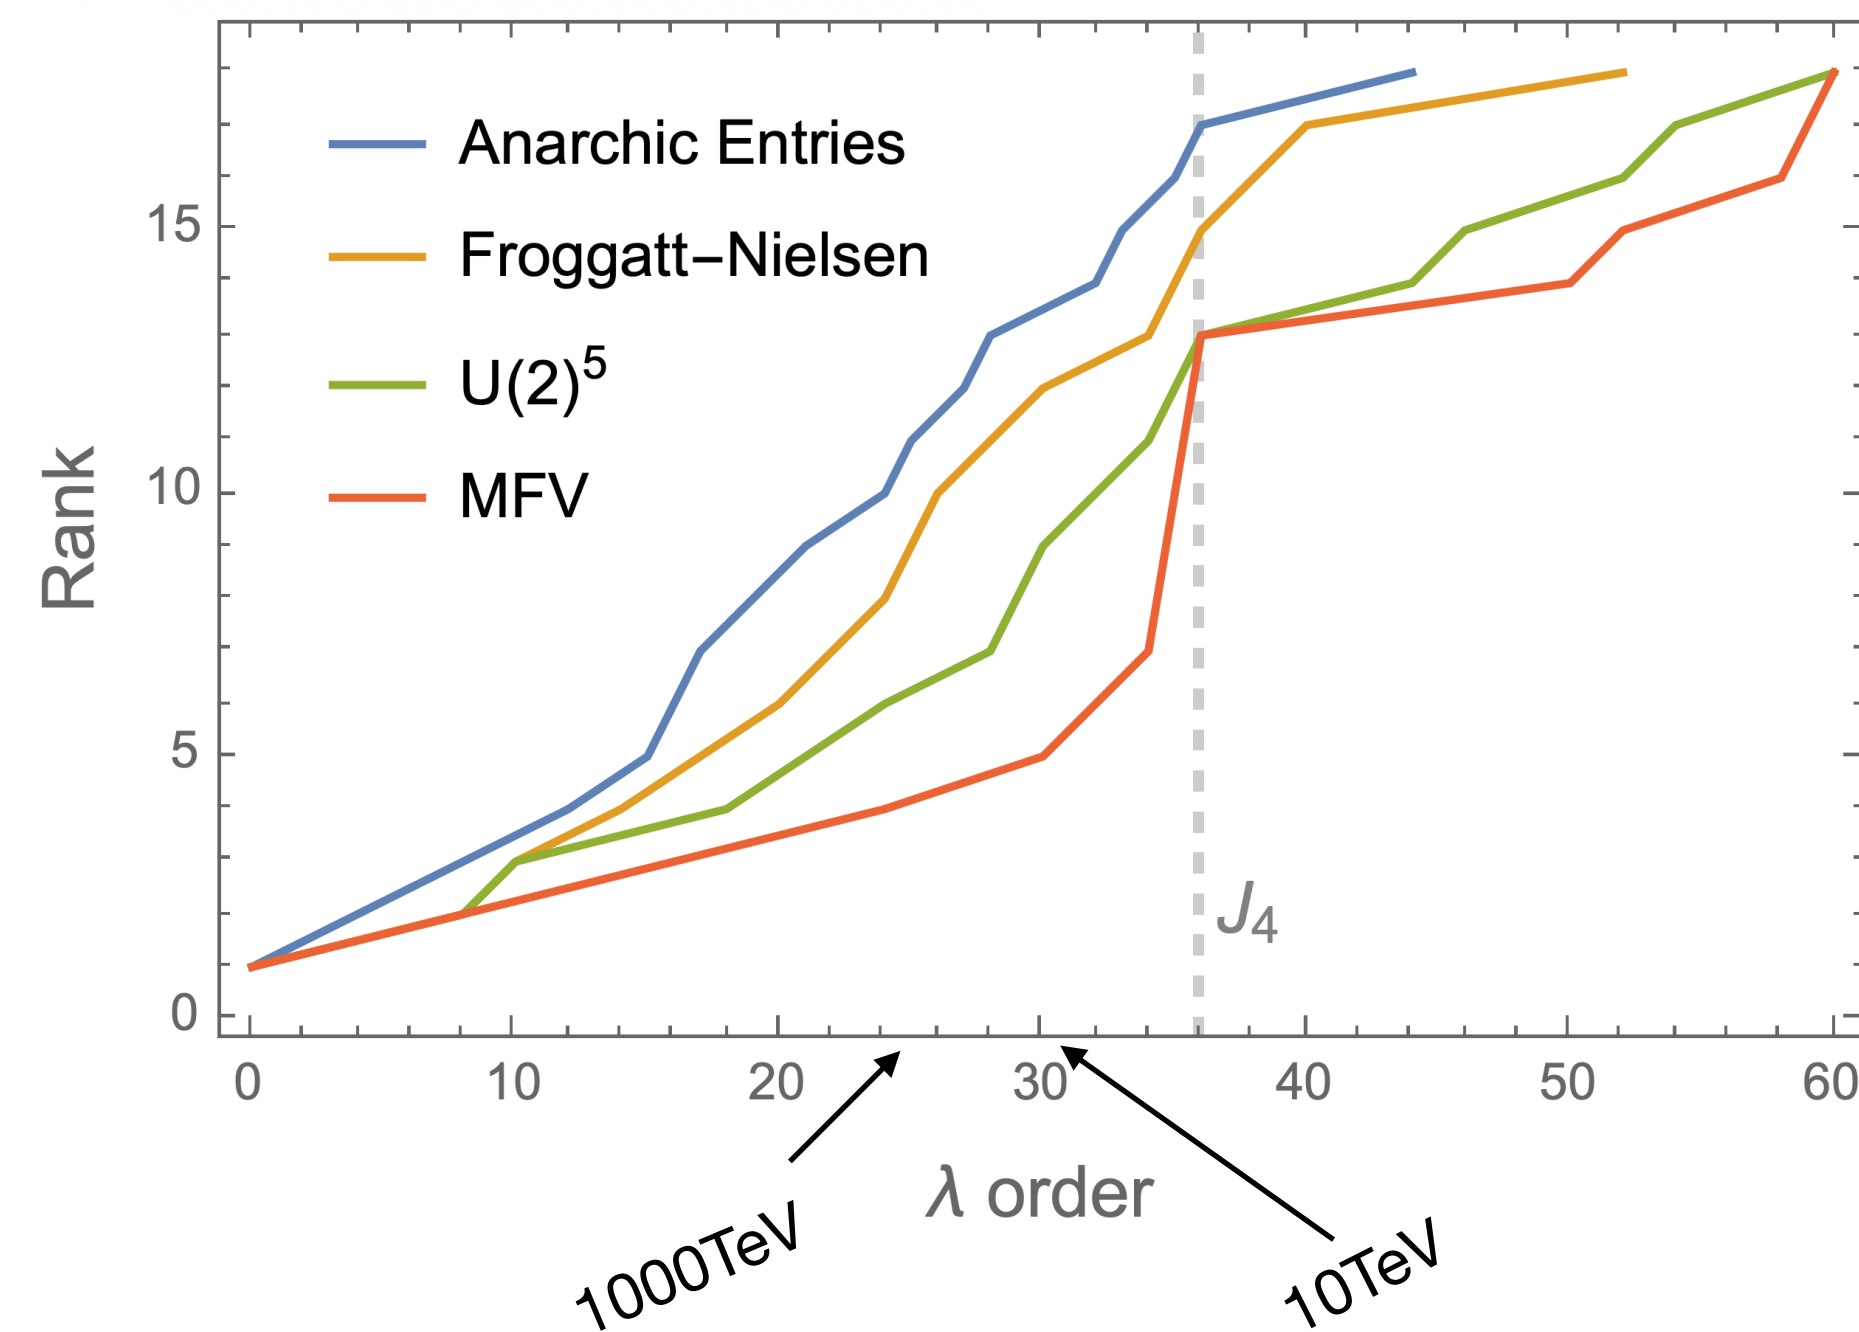

Froggatt-Nielsen-type & $U(2)^3$ Flavour Structure

- Another popular flavour structure is alignment inherited e.g. from $U(1)_{FN}$ symmetry
- The $U(1)$ charges of the quarks will imprint a particular scaling of the dim.6 WC:

$$Y_u = \begin{pmatrix} \lambda^8 & \lambda^5 & \lambda^3 \\ \lambda^7 & \lambda^4 & \lambda^2 \\ \lambda^5 & \lambda^2 & 1 \end{pmatrix}$$

$$Y_d = \begin{pmatrix} \lambda^7 & \lambda^6 & \lambda^6 \\ \lambda^6 & \lambda^5 & \lambda^5 \\ \lambda^4 & \lambda^3 & \lambda^3 \end{pmatrix}$$

$$C_{uH} = \text{generic} = \begin{pmatrix} \lambda^8 & \lambda^5 & \lambda^3 \\ \lambda^7 & \lambda^4 & \lambda^2 \\ \lambda^5 & \lambda^2 & 1 \end{pmatrix}$$

4-Fermi Operators

4F invariants from bilinear invariants

- In the Warsaw basis, Manohar et al. also counted the free-parameters in 4F operators: 1014 phases. As before, not all these phases can show up at leading order when the neutrino masses are taken to vanish: only 597 survive (adding to the 102 bilinear ones and J_4 for a total of 700 phases)

e.g. $C_{QuQd} \bar{Q}_u \bar{Q}_d$ $\frac{SU(3)_Q \quad SU(3)_u \quad SU(3)_d}{1 + 3 + 6 \quad \bar{3} \quad \bar{3}}$

- One can build two types of 4F-invariants out of the bilinear invariants:

A-type

$$\text{Im} \left(\underbrace{M_{ij}^{uH}} \underbrace{M_{kl}^{dH}} C_{ijkl}^{QuQd} \right)$$

B-type

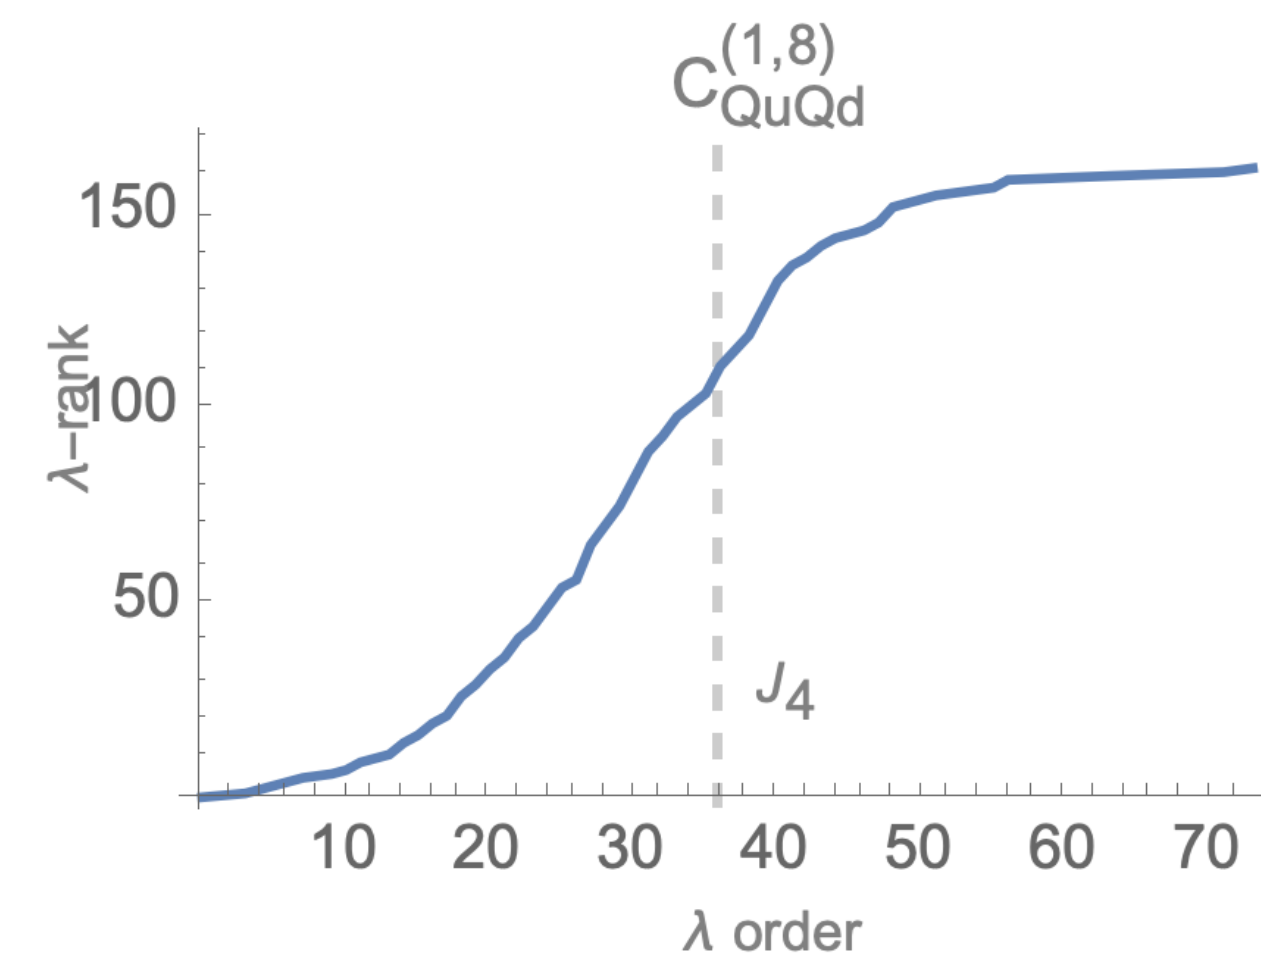

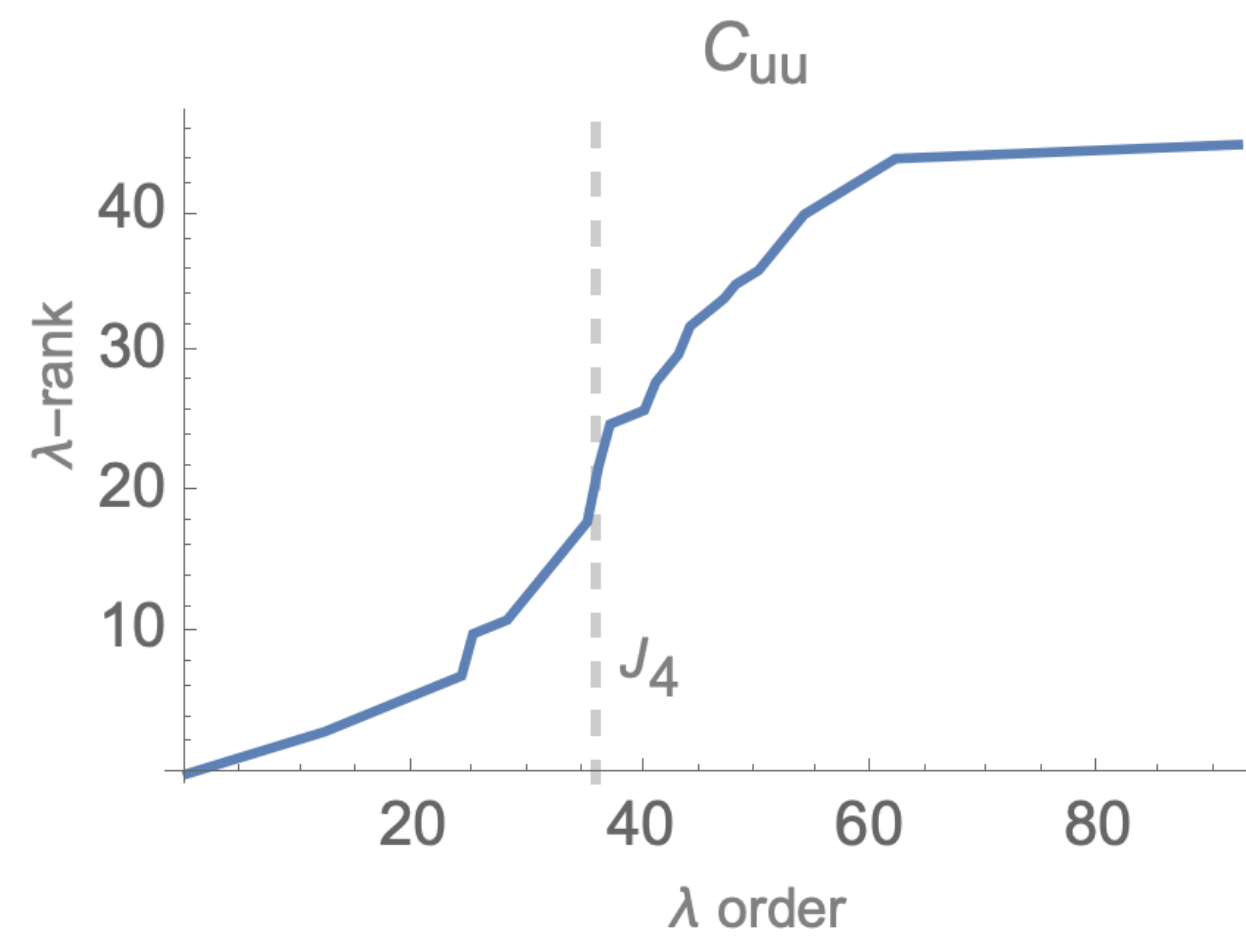

$$\text{Im} \left(\underbrace{M_{il}^{dH}} \underbrace{M_{jk}^{uH^\dagger}} C_{ijkl}^{QuQd} \right)$$

matrices built out of Y_u and Y_d that to form bilinear invariants, e.g., $\text{Im Tr} (M^{uH} C_{uH})$

An explicit basis of 597 invariants for the 4F operators can be built (see bonus slides)

4-Fermi Operators

independent invariants at $O(\lambda^n)$ for some 4F operators

Theta QCD

Can we build new invariants using Θ_{QCD} ?

	$SU(3)_{Q_L}$	$U(1)_{Q_L}$	$SU(3)_{u_R}$	$U(1)_{u_R}$	$SU(3)_{d_R}$	$U(1)_{d_R}$
Q_L	3	1	1	0	1	0
u_R	1	0	3	1	1	0
d_R	1	0	1	0	3	1
Y_u	3	1	$\bar{\mathbf{3}}$	-1	1	0
Y_d	3	1	1	0	$\bar{\mathbf{3}}$	-1
$e^{i\theta_{\text{QCD}}}$	1	6	1	-3	1	-3

- Given that $\bar{\theta} = \theta - \arg \det (Y_u Y_d)$ is a flavour invariant, no new SM_4 invariant can be constructed
- In SM_6 , in principle, new structure can emerge

$$\text{Im} \left(e^{-i\theta_{\text{QCD}}} \epsilon^{ABC} \epsilon^{abc} Y_{u,Aa} Y_{u,Bb} C_{uH,Cc} \det Y_d \right)$$

- Probably highly suppressed in the perturbative regime of QCD ($e^{-8\pi^2/g_s^2} \sim \lambda^{37}$)
- Relevant at low scale?

ALP shift-symmetry

ALP=Goldstone boson \rightarrow shift-symmetry

$$a \rightarrow a + \epsilon f$$

$$\mathcal{L} = \mathcal{L}_{\text{SM}} + \frac{1}{2} (\partial_\mu a) (\partial^\mu a) + \frac{\partial_\mu a}{f} \sum_{\psi \in \text{SM}} \bar{\psi} c_\psi \gamma^\mu \psi + \mathcal{O}\left(\frac{1}{f^2}\right)$$

$$\gamma_d \equiv -\frac{5}{12}g_1^2 - \frac{9}{4}g_2^2 - 8g_3^2 + \text{Tr}(X_e + 3(X_u + X_d))$$

closed set except for:

$$I_e^{(4)} = \text{Re Tr}(X_e^3 \tilde{Y}_e Y_e^\dagger)$$

$$I'_u = \text{Re Tr}((X_u X_d X_u + \{X_d, X_u^2\}) \tilde{Y}_u Y_u^\dagger + X_u^3 \tilde{Y}_d Y_d^\dagger)$$

$$I'_d = I'_u (u \leftrightarrow d)$$

but Caley-Hamilton eq. tells us that these 3 invariants are actually linear combinations of the our original set

shift-invariance conditions are closed under RG

Non-perturbative condition

Θ_{QCD} again

$$-\frac{C_g g_3^2}{16\pi^2} \frac{a}{f} \text{Tr}(G_{\mu\nu} \tilde{G}^{\mu\nu})$$

breaks shift-invariance non-perturbatively (instanton effects)
(in the operator basis where fermion couplings are derivative)

Non-perturbative condition

Θ_{QCD} again

$$-\frac{C_g g_3^2}{16\pi^2} \frac{a}{f} \text{Tr}(G_{\mu\nu} \tilde{G}^{\mu\nu})$$

breaks shift-invariance non-perturbatively (instanton effects)
(in the operator basis where fermion couplings are derivative)

$$I_g \equiv C_g + \text{Im Tr}(Y_u^{-1} \tilde{Y}_u + Y_d^{-1} \tilde{Y}_d) = 0$$

is the basis independent condition for the shift-invariance to be maintained at the non-perturbative level

Non-perturbative condition

Θ_{QCD} again

$$-\frac{C_g g_3^2}{16\pi^2} \frac{a}{f} \text{Tr}(G_{\mu\nu} \tilde{G}^{\mu\nu})$$

breaks shift-invariance non-perturbatively (instanton effects)
(in the operator basis where fermion couplings are derivative)

$$I_g \equiv C_g + \text{Im Tr}(Y_u^{-1} \tilde{Y}_u + Y_d^{-1} \tilde{Y}_d) = 0$$

is the basis independent condition for the shift-invariance to be maintained at the non-perturbative level

It can be shown again that this condition is **RG invariant**

$$\mu \frac{dI_g}{d\mu} = 0 \quad \text{whenever shift-symmetry holds } (l_g=l_i=0 \text{ for } i=1\dots 13)$$

Conclusions

EDM constraints don't exclude all sources of CPV

- CPV is a collective effect.
- CP is not an accidental symmetry but CPV is accidentally small in SM_4 .
- Many new possible sources of CPV at dim-6 level.
- Shift-symmetry of an ALP reduces to Jarlskog-like invariant conditions
- ALP shift-symmetry is surprisingly closed connected to CP-symmetry

We now have a proper map to explore BSM effects systematically

Conclusions

EDM constraints don't exclude all sources of CPV

- CPV is a collective effect.
- CP is not an accidental symmetry but CPV is accidentally small in SM₄.
- Many new possible sources of CPV at dim-6 level.
- Shift-symmetry of an ALP reduces to Jarlskog-like invariant conditions
- ALP shift-symmetry is surprisingly closed connected to CP-symmetry

We now have a proper map to explore BSM effects systematically

without proper map, we'll be lost in our BSM exploration!

정말 감사합니다

the 597 invariants associated to the 4F operators

4-Fermi Operators

Minimal and maximal bases

- As for the bilinears, one can construct a minimal basis of invariants:

“CP is conserved iff J_4 and the invariants of a minimal basis are all vanishing”

- The dimension of the **minimal** basis is always equal to the number of physical phases associated to an operator: $QQQQ \rightarrow 18$, $QuQd \rightarrow 81$, $LLuu \rightarrow 36/9$ (w/wo neutrino masses) ...
- But the real coefficients also contribute to CPV: the dimension of the **maximal** basis is equal to the total number of parameters associated to an operator: $QQQQ \rightarrow 45$, $QuQd \rightarrow 162$, $LLuu \rightarrow 81/27$ (w/wo neutrino masses) ...
