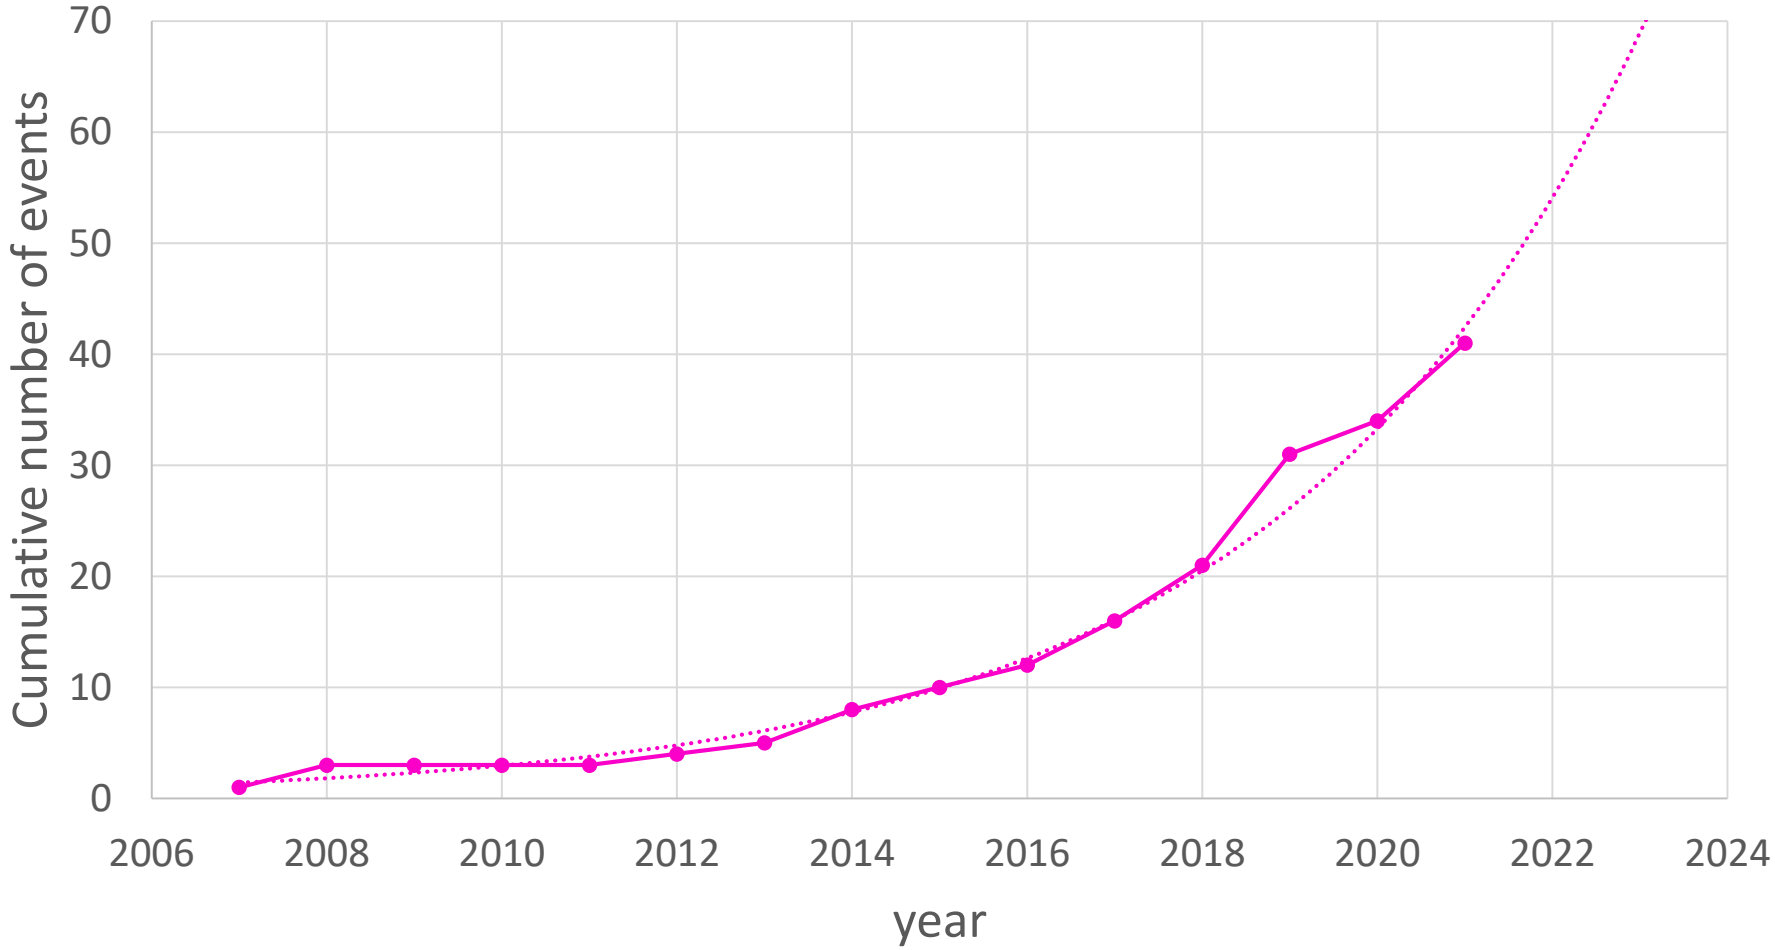
Additive Manufacturing applied to Particle Accelerators

I.FAST 1st Annual Meeting WP10.2.
05/05/2022, CERN

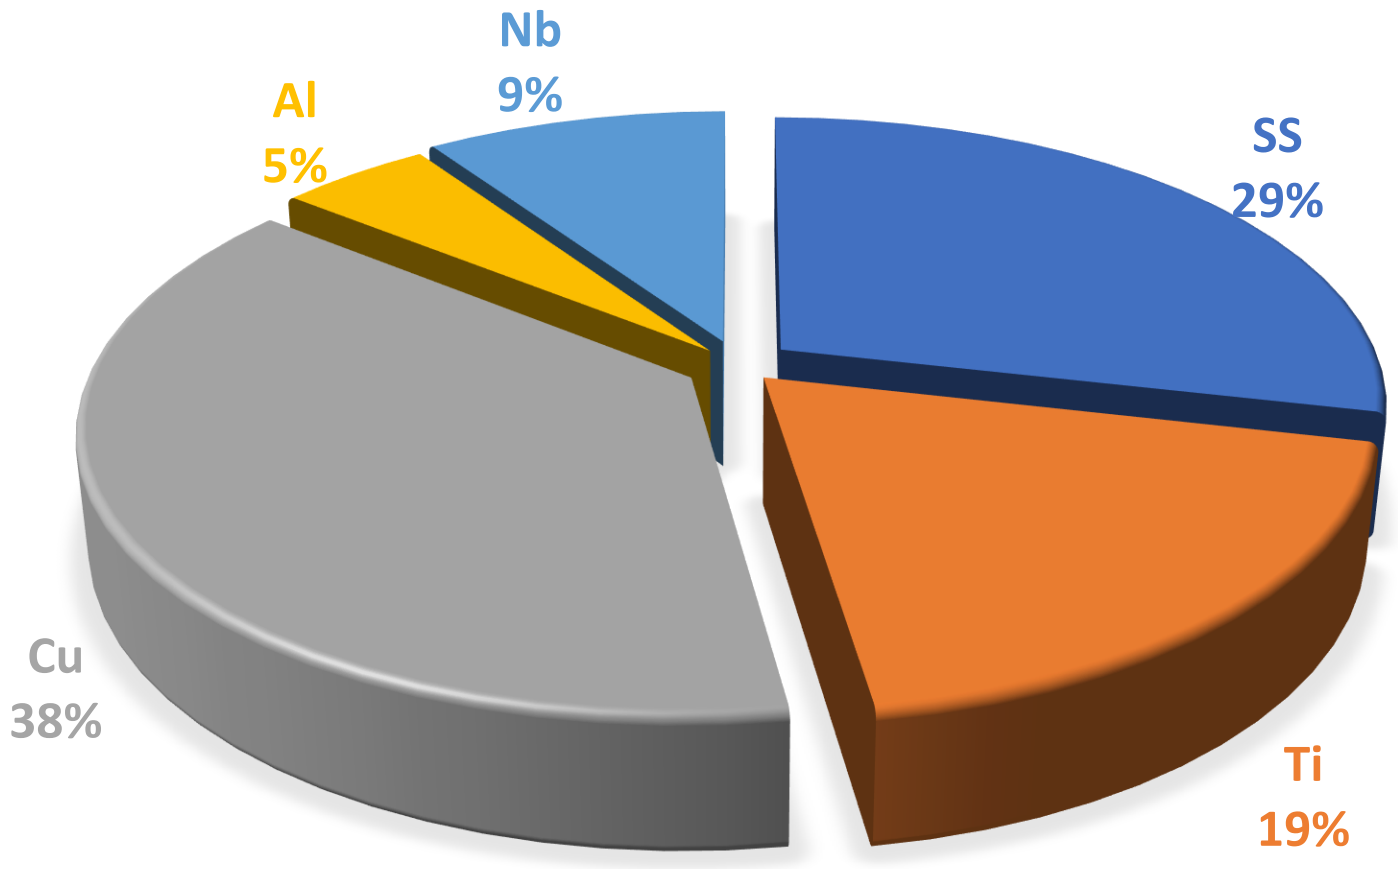
Guntis Pikurs (Riga Technical University)

iFAST

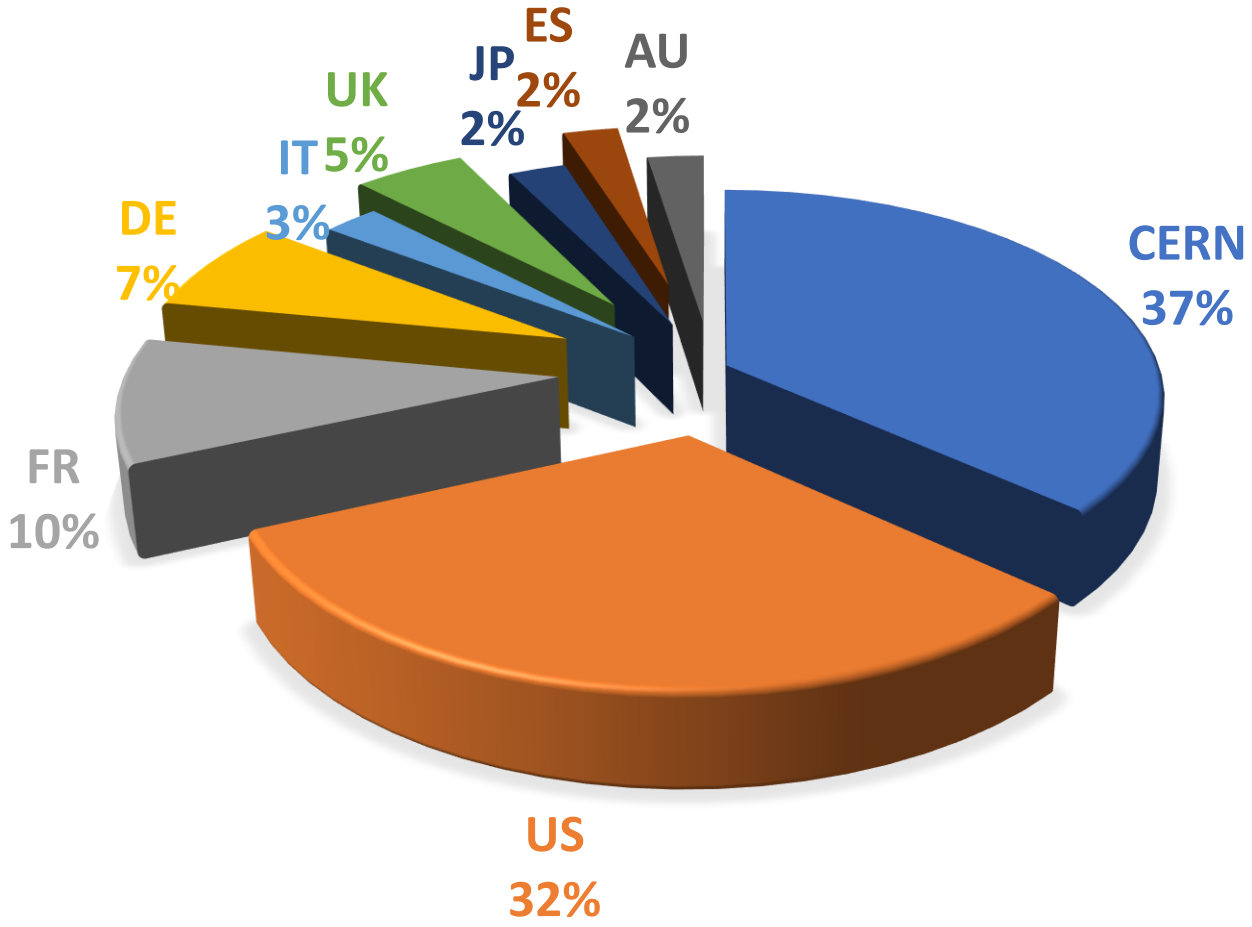
Recognized metal additive manufacturing activities within accelerator community



Materials used for accelerator parts



Distribution among countries



Europe:

CERN(CH)

LAL, CNRS/IN2P3(FR)

INFN(IT)

University of Nottingham(UK)

FAU(DE)

US:

SLAC

NCSU

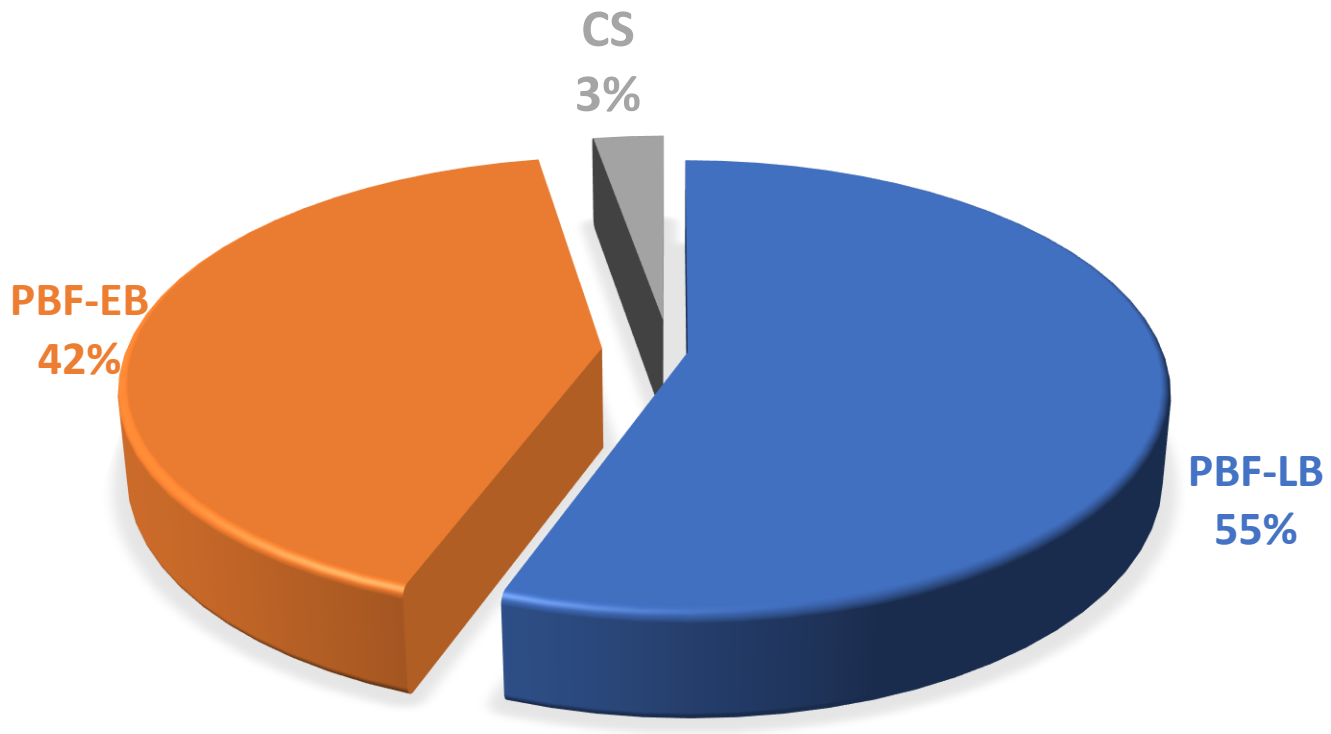
LLNL

RadiaBeam

Asia:

JEOL

Applied AM technologies for accelerators



Applied metal AM technologies:

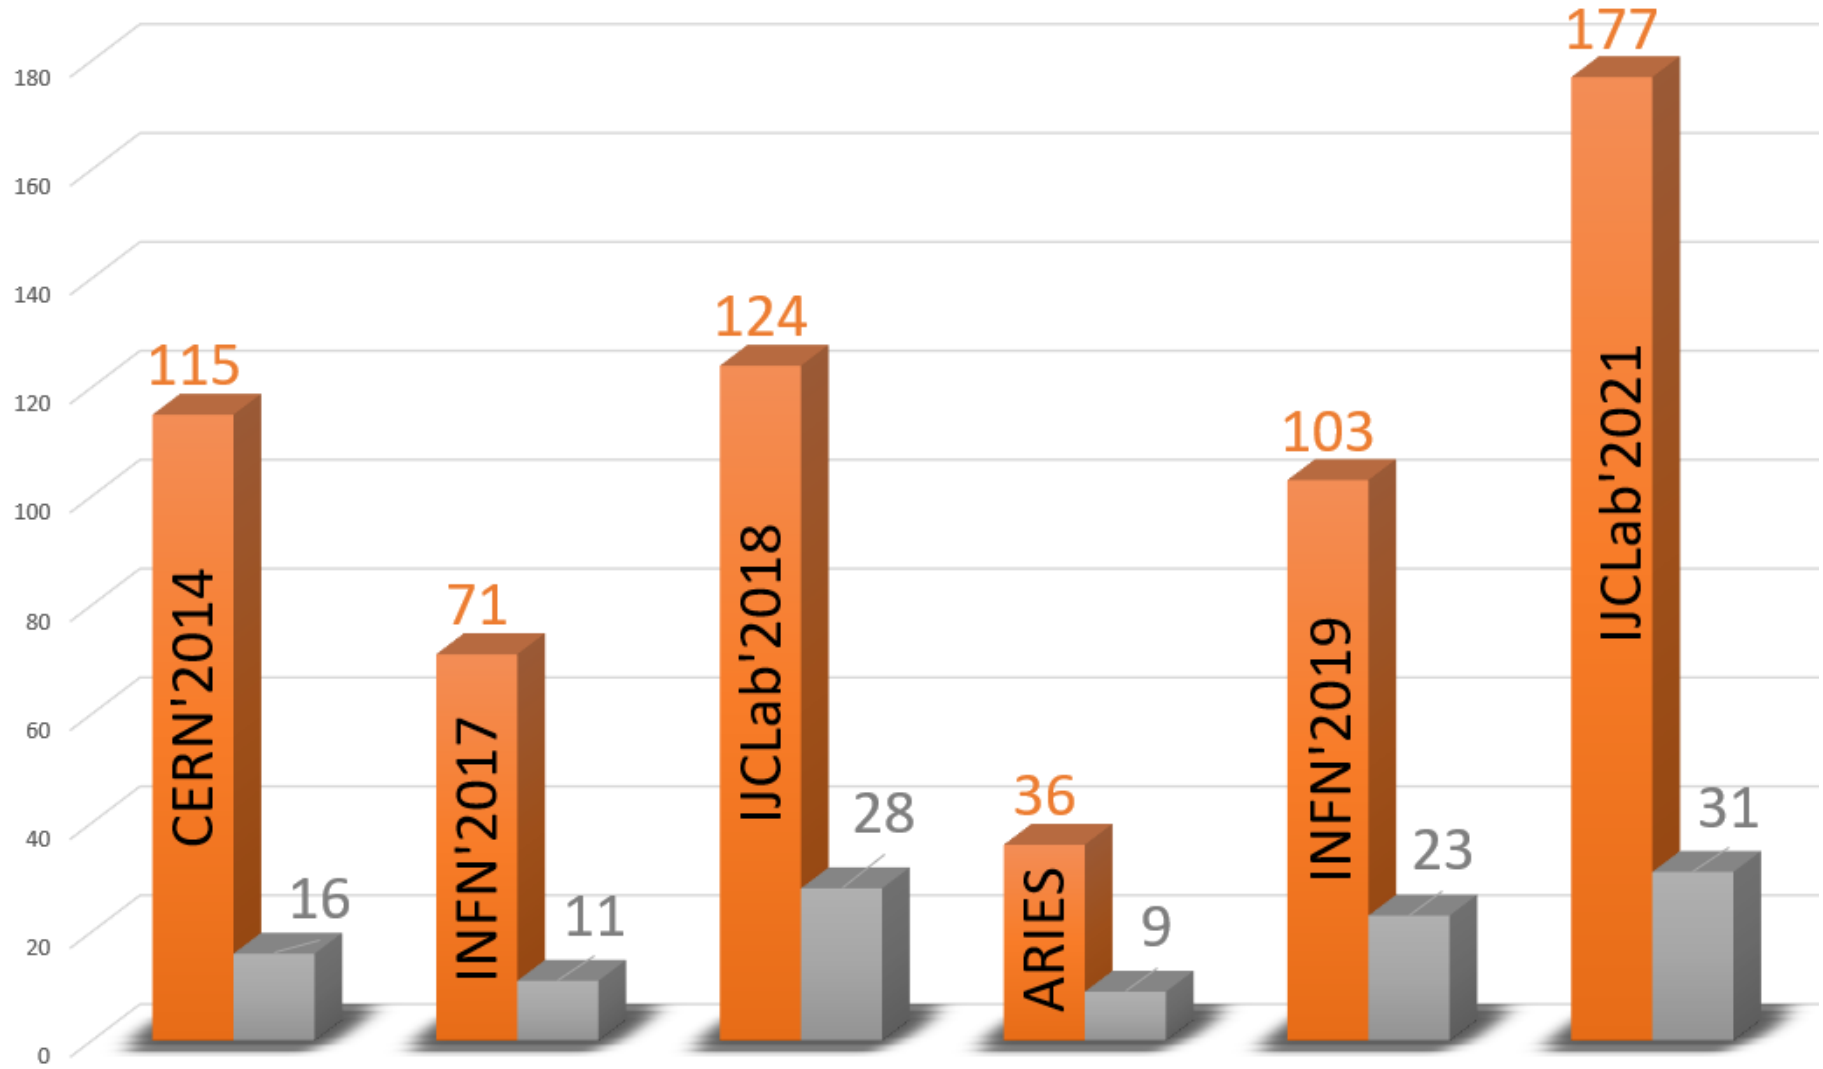
- PBF-LB
- PBF-EB
- Cold spray

Most often used AM machines:

- GE Arcam
- EOS
- SLM
- Renishaw
- Trumpf
- GE Concept Laser

AM Workshops dedicated to HEP

(registred participants/contributions)



Collage of metal AM parts within accelerators

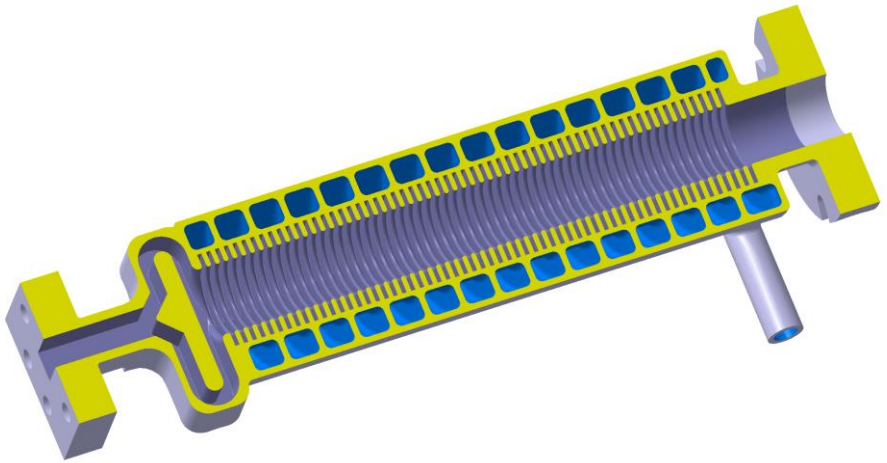
Highly efficient beam dump prototype for SPES LNL INFN

https://www.pd.infn.it/eng/infn-proposal-ranked-among-the-best-technology-transfer-projects-selected-by-the-regione-veneto/

Material: Cu OFHC;
Layer: 30 µm;
Machine: SISMA Mysint100 PM
Process: PBF-LB/M/CuOFHC;
Fiber laser, 1070nm;
Spot size of ~30 µm;
Max power 200W;
Printed volume: 88392 mm^3
Printing height Z of 32mm
Print job of ~75 hours
Reached relative density of 98.1 %

Compact X-band RF loads

Process: PBF-LB/M/Ti6V4Al



Alexej Grudiev, BE-RF

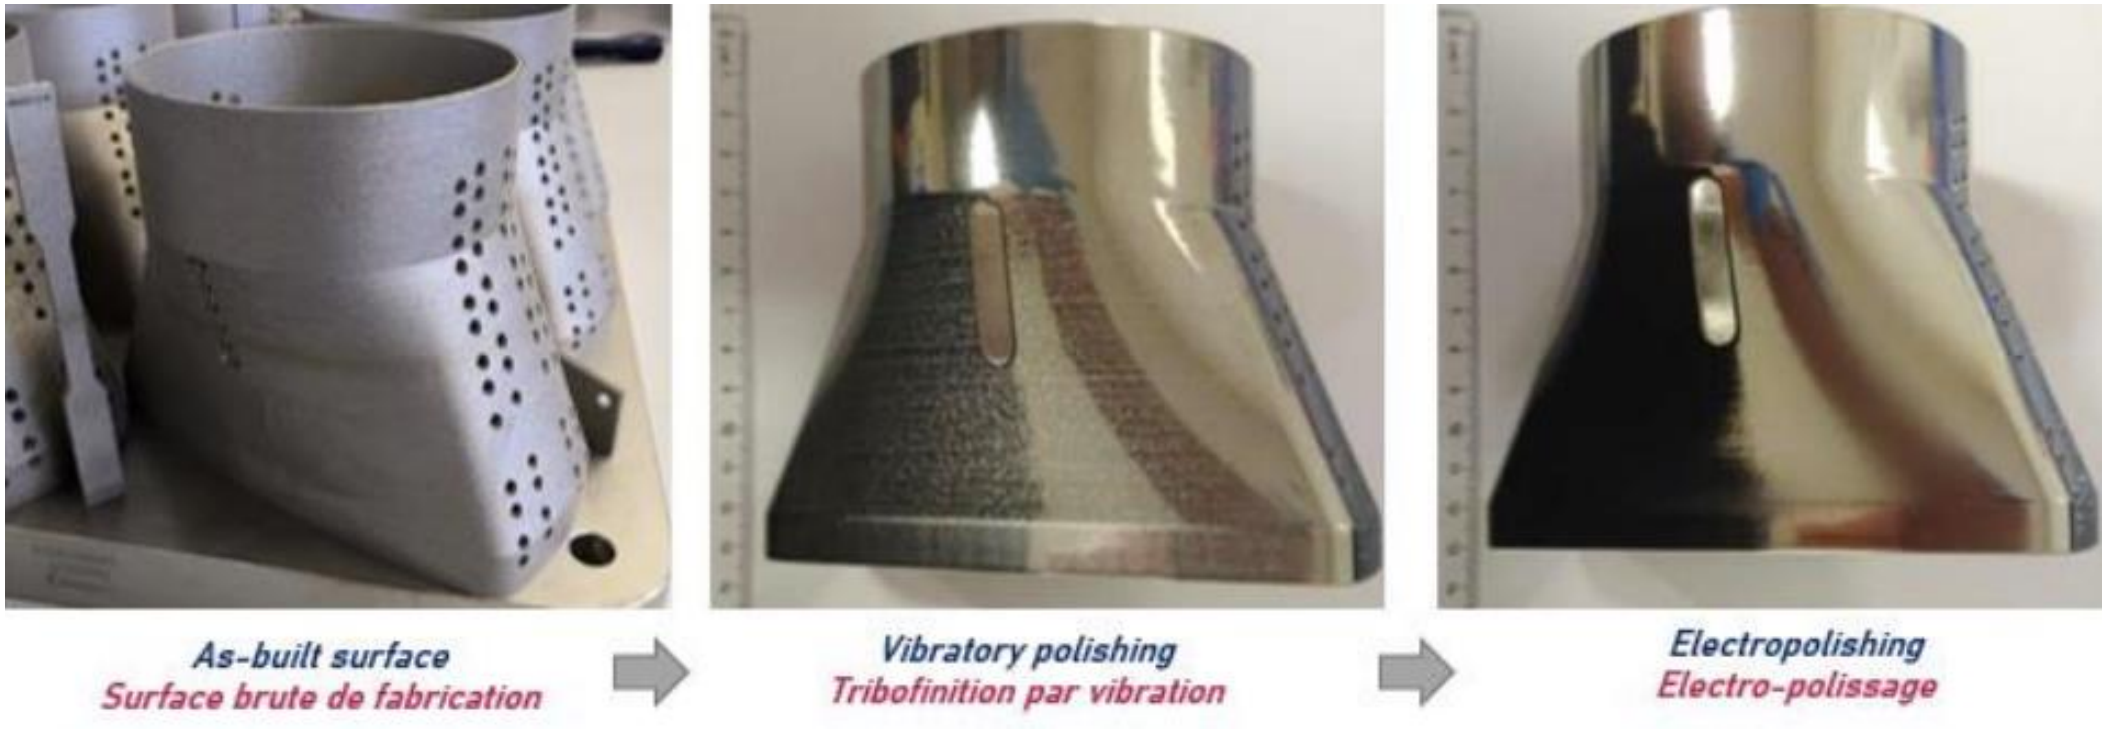
Vacuum

Ultra high vacuum tubes(IN2P3/CNRS)

https://accelconf.web.cern.ch/ipac2017/papers/wepva043.pdf

Material: 316L;
Vacuum test: (1.2×10^{-5} mbar; 9.6×10^{-6} mbar);
Size: 130 mm long DN40KF;
Build time:
30h for 4piece buildjob at 40µm layer thickness(BV Proto);
60h for 4piece buildjob at 20µm layer thickness(AGS Fusion);
As build surface roughness:
Ra = 8.5µm to 10µm for BV Proto;
Ra = 6µm to 7.5µm for AGS Fusion
Manufactured at:
BV Proto (http://bvproto.eu/);
Fusion AGS (https://www.ags-fusion.fr/)
Work supported by a grant from IN2P3/CNRS, program I3D metal.

SPS pumping port shielding (CERN)



https://indico.ijclab.in2p3.fr/event/7055/contributions/22436/attachments/16682/21653/R%20GERARD%20-%20La%20Fabrication%20Additive%20me%CC%81tal%20au%20De%CC%81partement%20d%27inge%CC%81nierie%20du.pdf

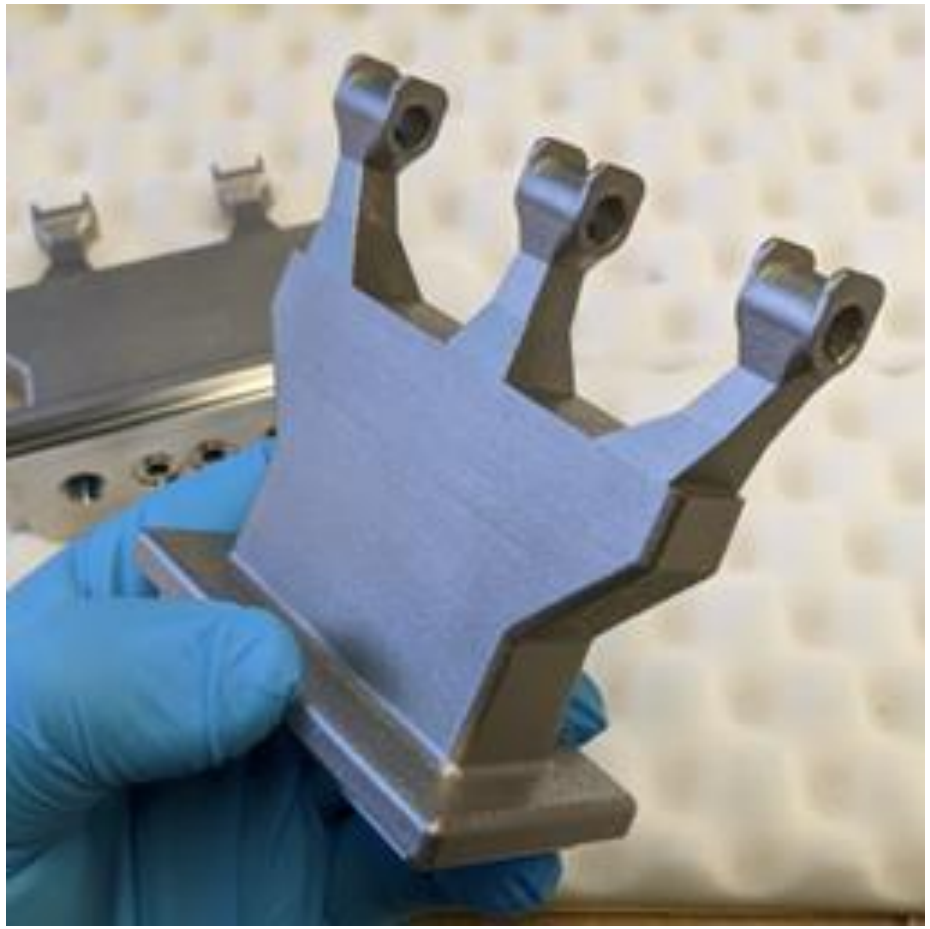
Ultra-high vacuum chamber below 10^{-10} mbar (UK)

Material: pre-alloyed, gas atomized AlSi10Mg powder from TLS Technik GmbH;
Grain size:10 µm to 100 µm;
Machine: Renishaw AM250
Process: PBF-LB/M/AlSi10Mg
Process parameters:

- 200W fiber laser@ 1064nm wavelength;
- 180°C bed temperature;
- layer thickness 25 µm;
- hatch spacing of 80 µm;
- point distance of 70 µm;
- exposure time of 220 µs;
- an effective scanning speed of 318mm/s;
- chequerboard pattern and 67° rotation after each layer.

Postprocessing: furnace cooling, EDM, bed blast, thermal treatment.

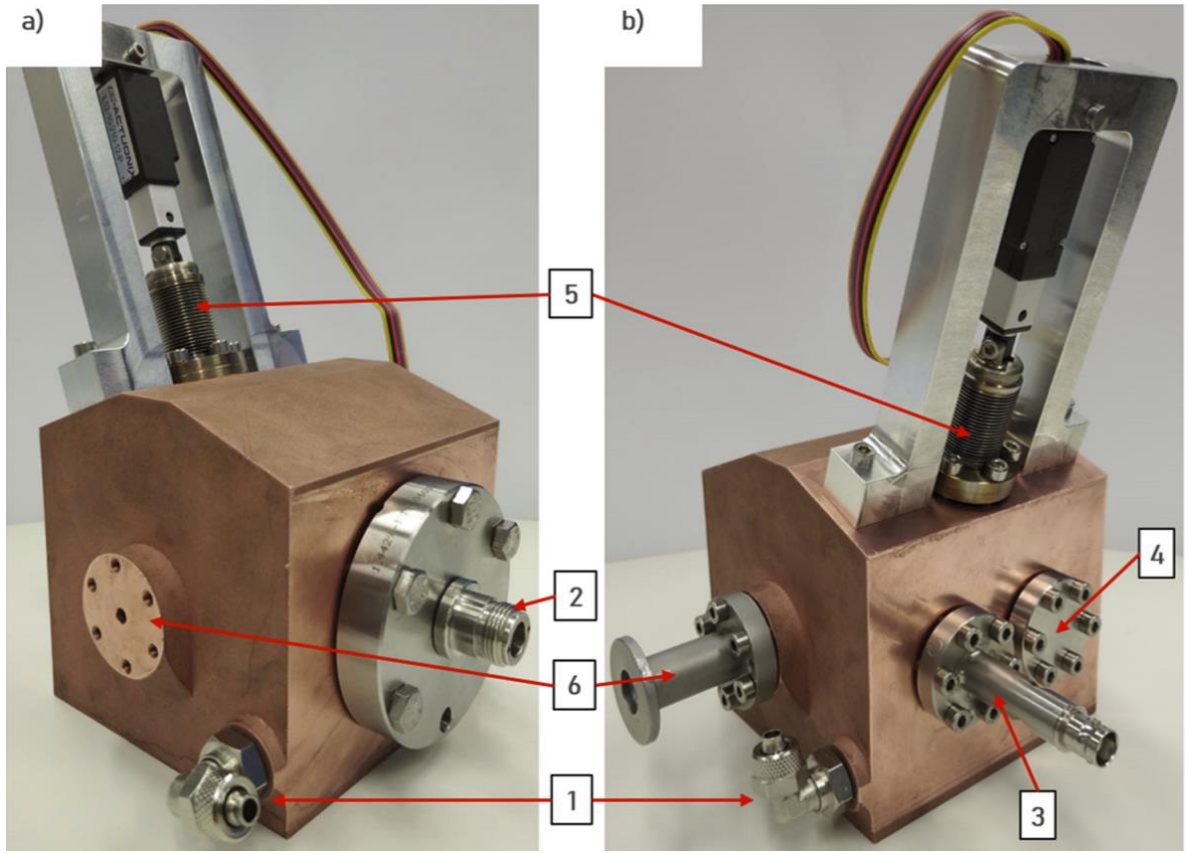
3D printed girder-drifttube structure including the integrated cooling channels



Material: 1.4404;
Vacuum, outgassing: 2.97×10^{-6} mbar was achieved after about 100h of pumping
Cavity size:221x206x261 mm
Developed at:
Goethe University, Frankfurt a. M.

https://accelconf.web.cern.ch/ipac2021/papers/mopab194.pdf

3D printed pure copper drift tube linac prototype



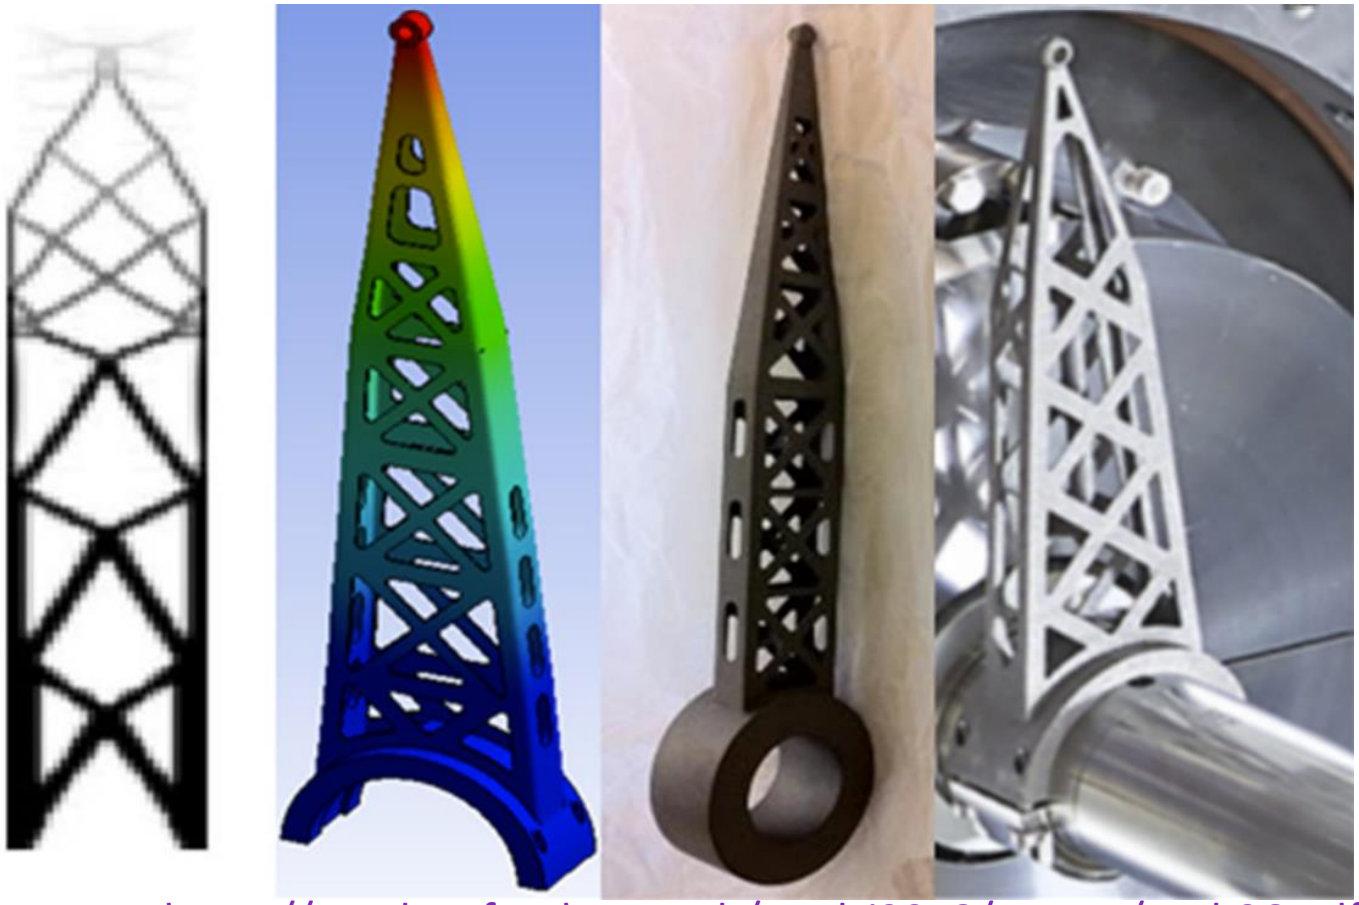
Process: PBF-LB/M/OFE-Cu;
Ordered at: PROTIQ GmbH;
Vacuum tightness: $2 \cdot 10^{-7}$ mbar reached in few hours

1-Valves cooling system;
2-Excitation loop;
3-Fickup loop;
4-Fixed copper tuner;
5-Variable copper tuner;
6-Aperture

https://doi.org/10.1063/5.0068494

Diagnostics

Fork for fast Beam Wire-Scanner (CERN)



Material: Ti6Al4V;
Powder: ~30 µm;
Machine: SLM 280HL
Process: PBF-LB/M/Ti6Al4V;
400W IPG fiber laser@ 1070nm wavelength;
Wall thickness 0.4mm

Raymond VENESS, SY-BI-ML

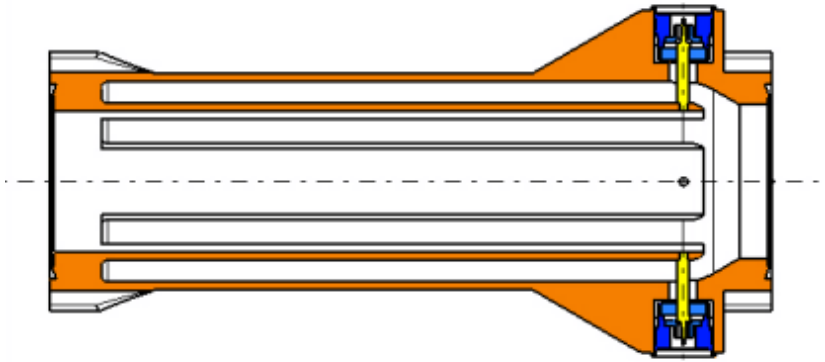
https://accelconf.web.cern.ch/medsi2018/papers/tuph36.pdf

HL-LHC: Beam screen spring

TE-VSC – C. Garion

https://indico.ijclab.in2p3.fr/event/4990/contributions/16695/attachments/13619/16418/I3DMetal_-_AMCERN.pdf

Beam Position Monitor (LAL, ThomX)



Material: 316L;
Technology: PBF-LB/M/316L
Developed at: LAL, TomX project
Advantages over traditional machining method:

- 60% of original weight;
- Cost reduction by 50%;
- Manufacturing time reduced by 2/3;

https://indico.ijclab.in2p3.fr/event/4990/contributions/16708/attachments/13635/16439/201812_Delerue_i3D_BPM.pdf

Warm RF

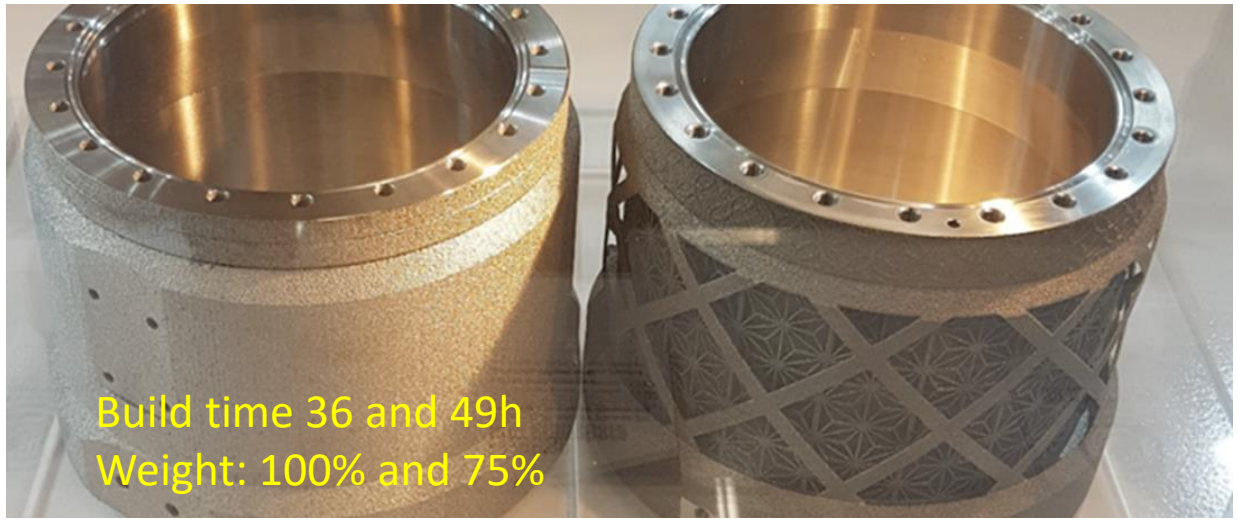
Additively manufactured HOM Coupler (CERN)

Courtesy of P.Trubacova (CERN EN-MME)

Process: PBF-LB/M/Ti6Al4V;
Postprocessed at: **BINC Industries**,
MMP average material removal **85.5 ± 23.9µm**
Final Ra0.02…0.03µm

https://indico.cern.ch/event/708160/contributions/2907448/attachments/1659769/2658741/MMP_development_RD_-_SRF_workshop.pdf

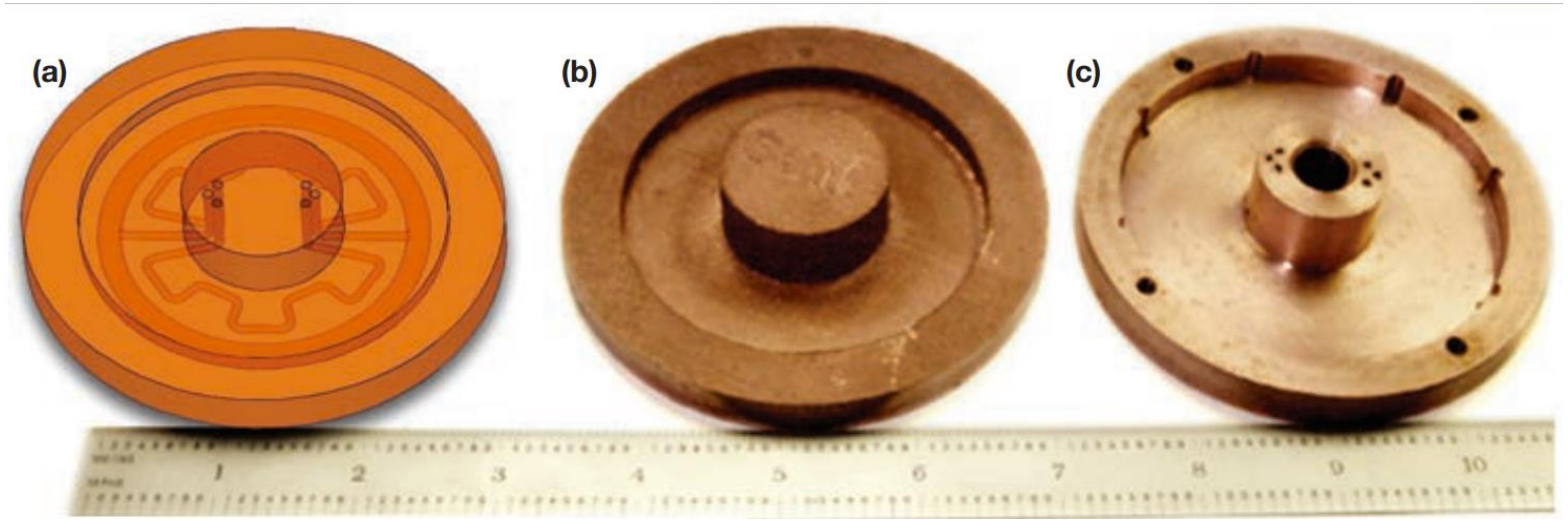
Electron gun and UHV chambers (JEOL)



Material: Ti-6Al-4V (grade23)
Machine: JEOL EBM
Process: PBF-EB/M/Ti6Al4V
Electron beam 1.2kW

Photos from exhibition FORMNEXT'2021, by G.Pikurs

EBM fabricated cathode for UCLA Pegasus 1.6 cell Photoinjector manufactured at RadiaBeam



Material: OFHC-Cu;
Technology: PBF-EB/M;
Machine: Arcam ;
Developed at: RadiaBeam;
Stable@PEF: 70MV/m;
Beam energy: 3.3MeV;
Charge: 60pC

https://www.asminternational.org/c/portal/pdf/download?articleId=19739462&groupId=10192

X-band klystron output cavity with micro-cooling channels and accelerator cavity

Credit: Christopher Ledford/North Carolina State University

Material: OFE-Cu;
Machine: Arcam S12
Process: PBF-EB/M/OFE-Cu;

https://www6.slac.stanford.edu/sites/www6.slac.stanford.edu/files/image1-2-side-by-side.jpg

Our experience on OFE-Cu RFQ ¼ sector

Material: m4p™ PureCu gas-atomised spherical shaped powder;

Powder size: 19.5 … 34.9 µm;

Machine: Trumpf TruPrint1000 Green Edition (500W disc laser@515nm wavelength);

Process: PBF-LB/M/OFE-Cu

Process parameters:

Layer thickness 30µm;

Print job: 16h 29min

Trumpf predefined scanning pattern;

Manufactured at: Fraunhofer IWS

Postprocessing at: Rosler Italiana S.R.L.

Lessons learned:

Successes:

- Good machining performance in terms of geometrical accuracy.

Issues to solve in future:

- STL model was not targeted and prepared for best result;
- Surface roughness is still challenge and definitely will need multi-step postprocessing;
- Circumstantial machine bed failure, due to powder bed sealing issue.

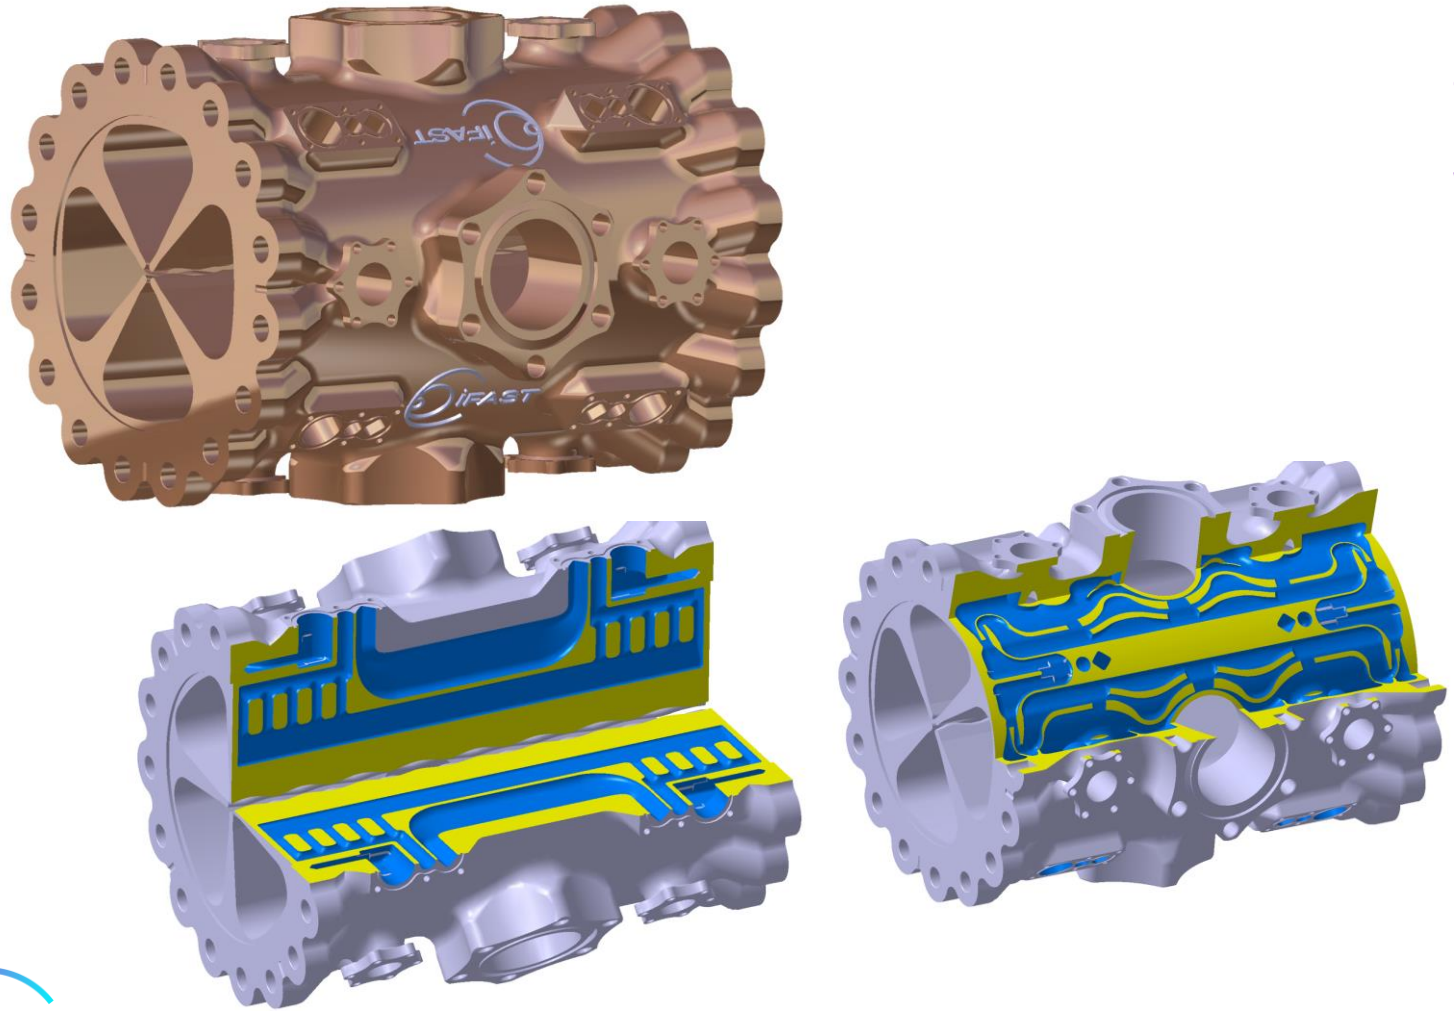
iFAST

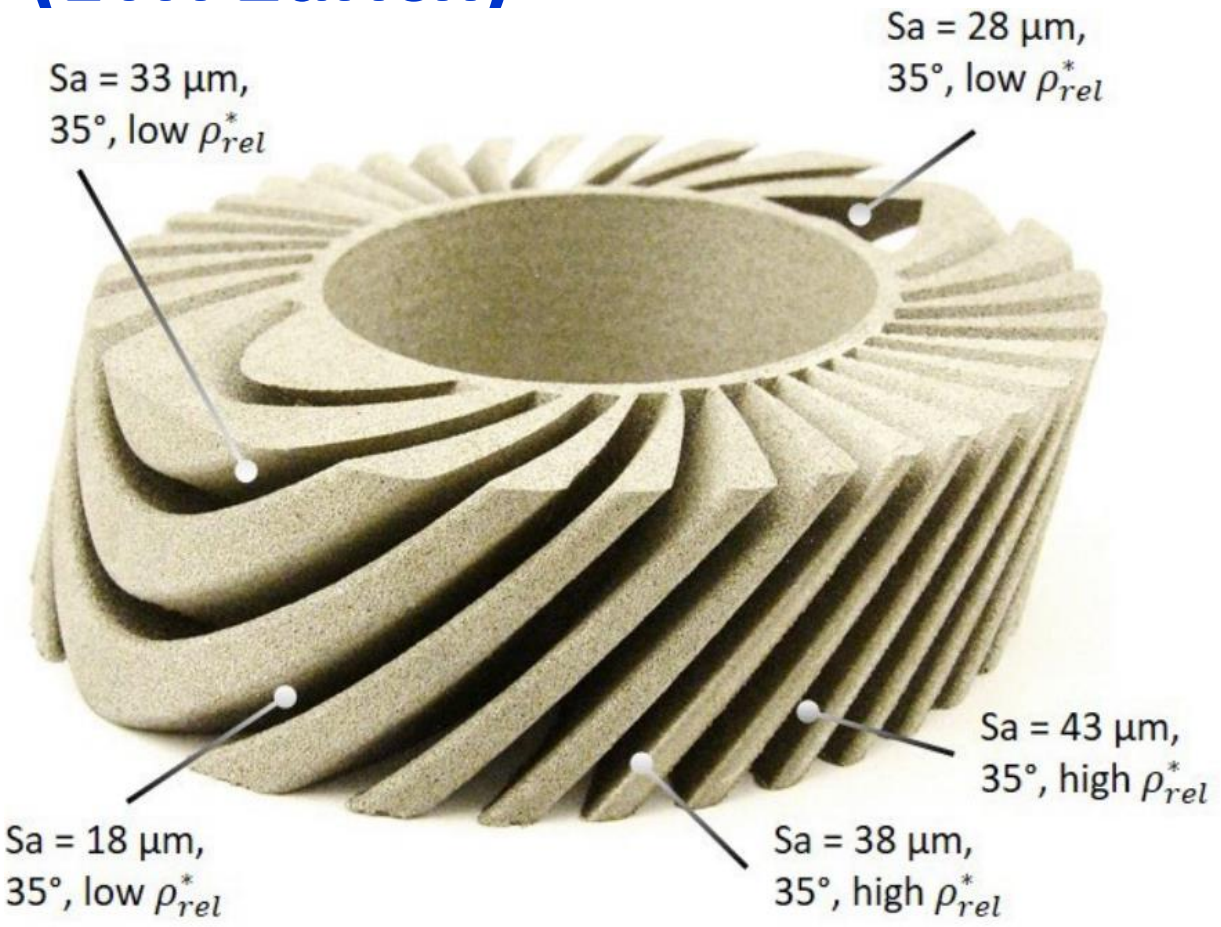
Next step: full sector RFQ prototype



Material: OFE-Cu;
Size ~∅200; L = 200mm
Material volume~984cm^3
Weight~8.8kg
Layer: 30 µm;
Machine: Trumpf Truprint Green Edition
Process: PBF-LB/M/OFE-Cu;
Green Disc laser, wavelength 515nm;

Superconductivity

Winding former of superconducting solenoid coil (ETH Zurich)



Material: 316L;
Layer: 30 µm;
Machine: Mlab Cusing R (GE Additive)
Process: PBF-LB/M/316L;
Yb:YAG fiber laser 1070 nm;
Focal diameter of 50 µm;
Max power 100W

Research is focused on manufacturing parameter optimization for different overhangs
