Supernova are a "hot" laboratory

<https://science.nasa.gov/toolkits/spacecraft-icons>

What's new?

- Use SN background (i.e. all past SN)
- Better SN control (different masses)
- Fermi data (spatial distribution etc)
- Take into account $O(20\%)$ effects (gravitational red-shift, alpha particles...)

The „predicted” picture

The constraint

Other couplings

- Also allows to constrain other couplings
- For example:

Combination of

proton coupling (efficient production)

+

electron coupling (decay to e^+e^- -pairs,
of which the e^+
annihilates with
background)

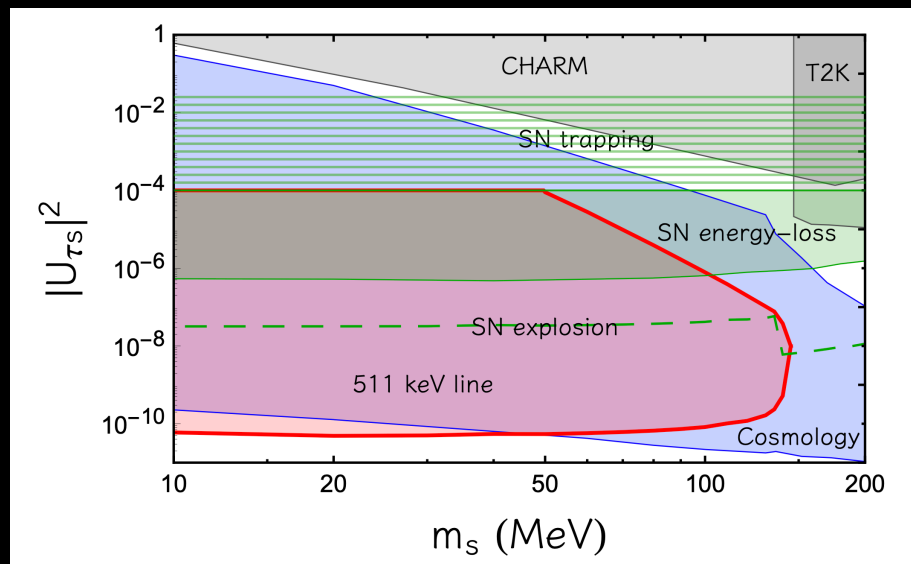

The constraint

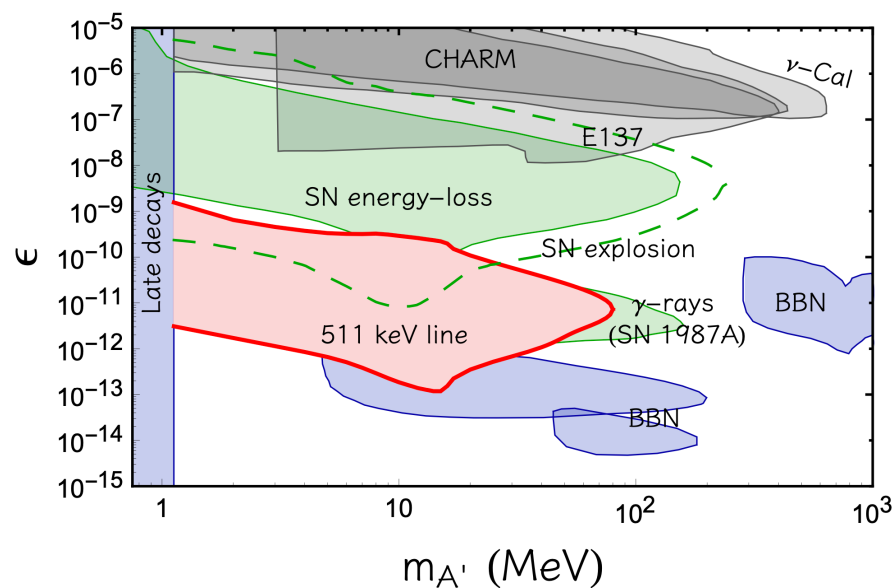

Other FIPs

Sterile Neutrinos

Dark Photons

Cosmo-News

Axionic/ALPy Dark Radiation

- Many (string) models feature a long-lived modulus Φ
- This reheats the Universe $\Phi \rightarrow SM$
- Significant branching ratio into axions/ALPs $\Phi \rightarrow a + a$
- These a are effective degrees of freedom visible in BBN and CMB
- often dangerous „Dark Radiation Problem“

M. Cicoli, J. P. Conlon, and F. Quevedo, “Dark radiation in LARGE volume models,” *Phys. Rev. D* **87** no. 4, (2013) 043520, [arXiv:1208.3562](https://arxiv.org/abs/1208.3562) [hep-ph].

A. Hebecker, P. Mangat, F. Rompineve, and L. T. Witkowski, “Dark Radiation predictions from general Large Volume Scenarios,” *JHEP* **09** (2014) 140, [arXiv:1403.6810](https://arxiv.org/abs/1403.6810) [hep-ph].

T. Higaki and F. Takahashi, “Dark Radiation and Dark Matter in Large Volume Compactifications,” *JHEP* **11** (2012) 125, [arXiv:1208.3563](https://arxiv.org/abs/1208.3563) [hep-ph].

S. Angus, “Dark Radiation in Anisotropic LARGE Volume Compactifications,” *JHEP* **10** (2014) 184, [arXiv:1403.6473](https://arxiv.org/abs/1403.6473) [hep-ph].

+ . . . + <https://arxiv.org/pdf/2203.08833.pdf>

The dark radiation problem

- String models usually have **too much axionic dark radiation**
- Reason: Long-lived volume modulus ϕ_b dominates the Universe before reheating it

$$BR_{\phi_b \rightarrow aa} \sim \frac{\Gamma_{\phi_b \rightarrow aa}}{\Gamma_{\phi_b \rightarrow SM} + \Gamma_{\phi_b \rightarrow aa}} \sim \frac{1}{1 + 2z^2} \sim \mathcal{O}(1)$$

$$\Delta N_{\text{eff}} \sim 6.1 \left(\frac{11}{g_*^4 g_{*,S}^{-3}} \right)^{1/3} BR(\phi \rightarrow aa)$$

But:

$$\Delta N_{\text{eff}} \lesssim 0.2 - 0.4$$

Possible Solution: Decay to Higgses

- SUSY breaking generates coupling to Higgses

.... an actually not so long calculation...

$$\Gamma_{\phi_b \rightarrow hh} \sim \frac{m_{3/2}^4 c_{\text{loop}}^2}{m_{\tau_b} M_P^2} \sim (c_{\text{loop}} \mathcal{V})^2 \frac{m_{\tau_b}^3}{M_P^2} \gg \Gamma_{\phi_b \rightarrow a_b a_b}$$

$$BR_{\phi_b \rightarrow aa} \ll 1$$

→ Problem reduced
(or at least pushed to inflationary sector)

Inflaton may be longes-lived modulus

- Inflaton decay now slower than volume modulus

$$\Gamma_{\text{inflaton}} \sim \mathcal{V}^{-4} \gtrsim \Gamma_{\phi_b} \sim c_{\text{loop}}^2 \mathcal{V}^{-2.5}$$

- May dominate Universe

$$BR(\text{inflaton} \rightarrow a + X) \sim \frac{1}{1+x}$$

O(1)-O(100)
work in progress*

Dark Radiation may be detectable + Useful

- For example in IAXO

Physics potential of the International Axion Observatory (IAXO)

IAXO Collaboration • E. Armengaud (IRFU, Saclay) et al. (Apr 19, 2019)

- But also other experiments

Cosmic axion background

Jeff A. Dror (UC, Santa Cruz and UC, Santa Cruz, Inst. Part. Phys. and UC, Berkeley and LBNL, Berkeley), Hitoshi Murayama (UC, Berkeley and LBNL, Berkeley and Tokyo U., IPMU), Nicholas L. Rodd (UC, Berkeley and LBNL, Berkeley)

- Might be interesting to think beyond scalar photon couplings!

New tool to probe Reheating

- This dark radiation may allow to get access to information about reheating

Figure. 1. The differential flux of the messenger particle, $d^2 \Phi / d \log_{10} E d\Omega$. CASE A (ϕ once dominated the Universe) and CASE B (ϕ never dominates the Universe and decay in the radiation dominant epoch) are shown in red and black lines, respectively. We also show the flux for CASE C where a subdominant ϕ decays in the matter dominant era as the blue dashed line.

New tool to probe Reheating

Measures

$$\frac{m_{\Phi}}{T_{\Phi}}$$

Figure. 1. The differential flux of the messenger particle, $d^2 \Phi / d \log_{10} E d \Omega$. CASE A (ϕ once dominated the Universe) and CASE B (ϕ never dominates the Universe and decay in the radiation dominant epoch) are shown in red and black lines, respectively. We also show the flux for CASE C where a subdominant ϕ decays in the matter dominant era as the blue dashed line.

Measure reheating temperature

Figure. 2. The reheating flux dependence on the decoupling effect: $T_\phi = 400 \text{ MeV}$ (red-solid line) and $T_\phi = 200 \text{ MeV}$ (blue-dashed line, CASE A). We take $g_\star, g_{S\star}$ temperature in-

Crazy-News

Crazy-News

Poincare Symmetry Violation

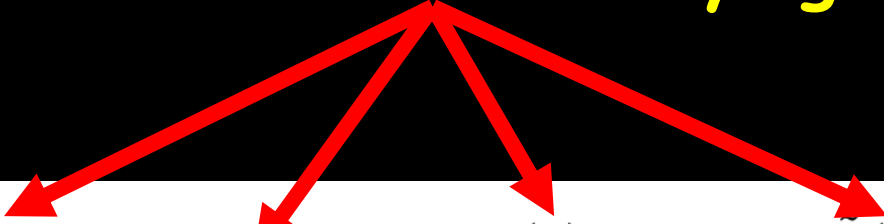

Poincare Symmetry

- Lorentz Invariance (→Kostelecky et al)
- Time Translation Invariance
→ Energy Conservation
- Space Translation Invariance
→ Momentum Conservation

We start here

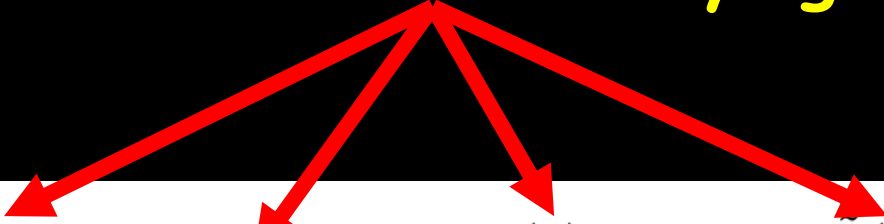

Looking at PV QED

- Simple implementation: Time varying couplings

$$\mathcal{L} = i\bar{\psi}\not{D}_{\mu}\psi - m(x)\bar{\psi}\psi - i\tilde{m}(x)\bar{\psi}\gamma^5\psi - \frac{Z(\mathbf{x})}{4}F_{\mu\nu}F^{\mu\nu} - \frac{\tilde{Z}(x)}{4}F_{\mu\nu}\tilde{F}^{\mu\nu}$$

Looking at PV QED

- Simple implementation: Time varying couplings

$$\mathcal{L} = i\bar{\psi}\not{D}_{\mu}\psi - m(x)\bar{\psi}\psi - i\tilde{m}(x)\bar{\psi}\gamma^5\psi - \frac{Z(\mathbf{x})}{4}F_{\mu\nu}F^{\mu\nu} - \frac{\tilde{Z}(x)}{4}F_{\mu\nu}\tilde{F}^{\mu\nu}$$

- What's new?
 - Consider broad range of time-variations (future)
 - Take energy violation seriously

Looking at PV QED

- Simple implementation: Time varying couplings

$$\mathcal{L} = i\bar{\psi}\not{D}_\mu\psi - m(x)\bar{\psi}\psi - i\tilde{m}(x)\bar{\psi}\gamma^5\psi - \frac{Z(x)}{4}F_{\mu\nu}F^{\mu\nu} - \frac{\tilde{Z}(x)}{4}F_{\mu\nu}\tilde{F}^{\mu\nu}$$

- For now: Simple periodic time variation

$$\begin{aligned}\delta Z(x) &= Z(x) - 1 = \sum_{\omega} \delta Z(\omega) \cos \omega t \\ \tilde{Z}(x) &= \sum_{\omega} \tilde{Z}(\omega) \cos \omega t \\ \frac{\delta m(x)}{m_e} &= \frac{m(x) - m_e}{m_e} = \sum_{\omega} \frac{\delta m(\omega)}{m_e} \cos \omega t \\ \frac{\tilde{m}(x)}{m_e} &= \sum_{\omega} \frac{\tilde{m}(\omega)}{m_e} \cos \omega t\end{aligned}$$

Looking at PV QED

- Simple implementation: Time varying couplings

$$\mathcal{L} = i\bar{\psi}\not{D}_\mu\psi - m(x)\bar{\psi}\psi - i\tilde{m}(x)\bar{\psi}\gamma^5\psi - \frac{Z(x)}{4}F_{\mu\nu}F^{\mu\nu} - \frac{\tilde{Z}(x)}{4}F_{\mu\nu}\tilde{F}^{\mu\nu}$$

- For now: Simple periodic time variation

$$\begin{aligned}\delta Z(x) &= Z(x) - 1 = \sum_{\omega} \delta Z(\omega) \cos \omega t \\ \tilde{Z}(x) &= \sum_{\omega} \tilde{Z}(\omega) \cos \omega t \\ \frac{\delta m(x)}{m_e} &= \frac{m(x) - m_e}{m_e} = \sum_{\omega} \frac{\delta m(\omega)}{m_e} \cos \omega t \\ \frac{\tilde{m}(x)}{m_e} &= \sum_{\omega} \frac{\tilde{m}(\omega)}{m_e} \cos \omega t\end{aligned}$$

Might be interesting to allow for broad spectrum, or even white noise

Breaks Lorentz invariance, too

- Time varying couplings have

$$\partial_{\mu} \delta Z(x) \neq 0$$

- Non-vanishing Lorentz vector \rightarrow Lorentz symmetry is broken, too

\rightarrow Need to specify rest frame

\rightarrow We take CMB rest frame

Looks like (pseudo-)Scalar DM?

- One origin of oscillation could be scalar DM

$$\delta Z(t) \sim g\phi(t) \sim g\phi_0(t) \cos(mt)$$

- We want to be more general

(less constrained by reason)

- DM predicts specific $\phi_0(t) \sim a^{-3/2}$
vs. we consider $\phi_0(t) \sim \text{const}$
- No gravitational clumping (+fixed frequency spectrum)
- No particle excitations
 - astrophysical energy loss bounds gone
- No forces from a particle exchange
 - no fifth forces

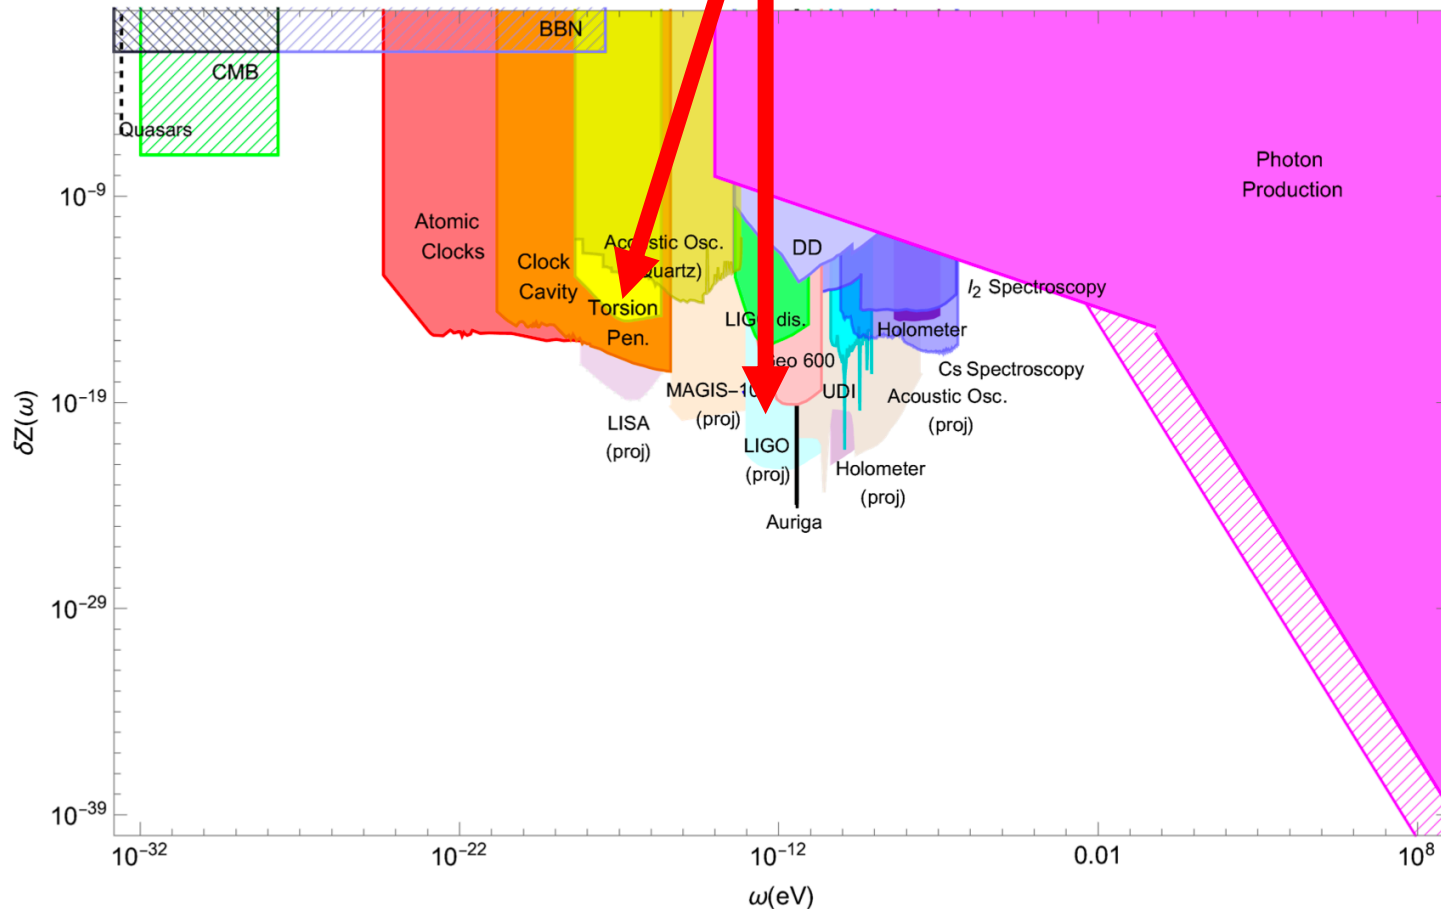

Results

- "Standard" limits from time varying constants

Results

- Oscillating Forces in experiments moving with respect to the rest frame (a la DM)

Particles from nothing

- An $\delta Z \sim \cos(\omega t)$ is like an oscillating driving force for photons

→ Photon creation

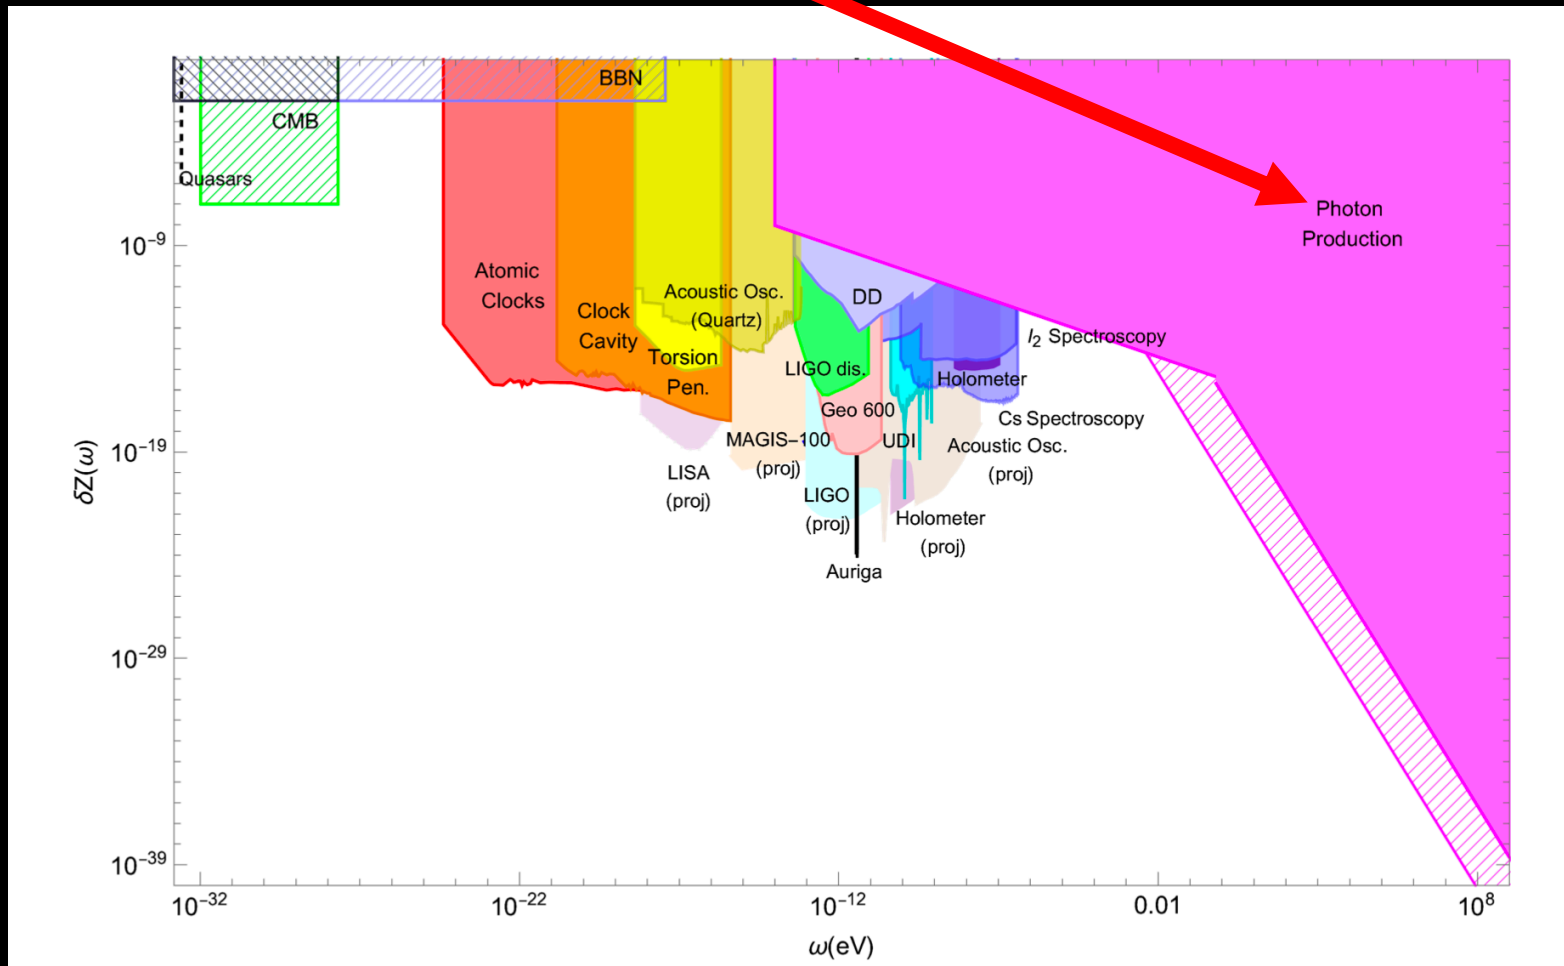

$$\dot{n}_\gamma(\omega) = (2N_k + 1) \frac{(\delta Z(\omega))^2 \omega^4 \beta_\gamma}{64\pi},$$

(analog to resonant DM decay)

- Visible Photons, too much energy created etc.
-

Results

- Particle creation from vacuum (too much)

Energy violation in scattering events

- Energy violation in scattering possible

$$e + \gamma (E) \rightarrow e + \gamma (E \pm \omega)$$

- Expect (because of phase space)

$$\sigma(E \rightarrow E - \omega) < \sigma(E + \omega)$$

→ Net energy gain on average

→ For example Sun would „gain“ energy

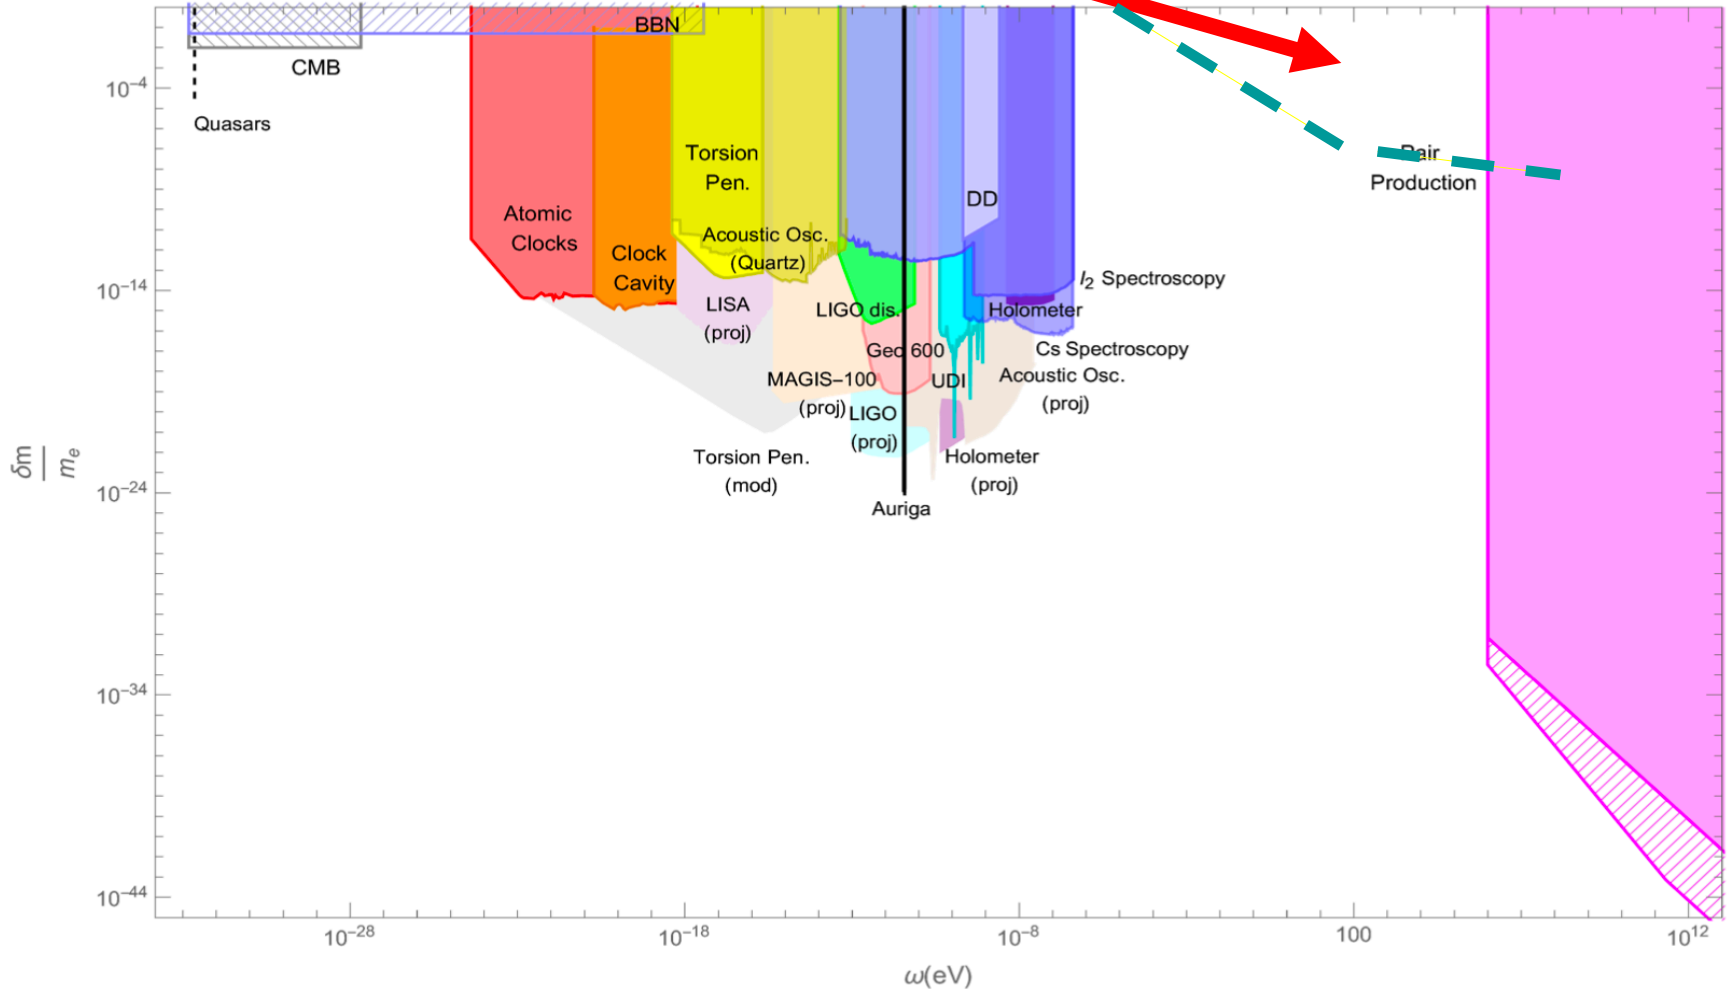

Results

- Energy conservation in Sun (TBC_(larified))

Results: Better for pseudoscalars

- Energy conservation in Sun (TBC_(larified))

Conclusions

Conclusions

- Astrophysical limits continue to improve
- Supernova rich source or FIPs
- Consider variety and combination of couplings
- Cosmic, „Dark Radiation“ of FIPs interesting for detection + probing cosmology
- Crazy Things like Poincare Violation/Energy Violation/Momentum Violation should also occasionally be tested
 - Might be interesting to search for variations/driving forces with non-trivial spectrum
