A numerical-relativity gravitational-wave catalogue of spinning Proca-star collisions

Wednesday, 22 June 2022 17:30 (20 minutes)

We have performed a systematic study of the dynamics and the emission of gravitational radiation in head-on collisions of dynamically robust spinning vector boson stars, aka Proca stars. We find that the wave-like nature of bosonic stars has large impact on the gravitational-wave emission. The energy emitted in gravitational waves critically depends on the difference between the oscillation frequencies of the primary and secondary stars $\Delta\omega = (\omega_1 - \omega_2)/\omega$ in a non-monotonic way. In the unequal-mass case we observe a periodic modulation of the radiated energy as a function of ω_2/ω of the secondary star with fixed ω_1/ω that we relate to constructive and destructive interference due to the interaction of the Proca field with itself.
