$$

"bound" state:
color singlet

## Why are these correlators interesting?

## Quarkonium in the quantum brownian motion limit

 $M v \gg T \gg M v^{2}$ (Brambilla et al.)$$
\frac{d \rho_{S}(t)}{d t}=-i\left[H_{S}+\Delta H_{S}, \rho_{S}(t)\right]+\kappa_{\mathrm{adj}}\left(L_{\alpha i} \rho_{S}(t) L_{\alpha i}^{\dagger}-\frac{1}{2}\left\{L_{\alpha i}^{\dagger} L_{\alpha i}, \rho_{S}(t)\right\}\right)
$$

The correlators determine the transport coefficients:

$$
\begin{aligned}
& \gamma_{\mathrm{adj}} \equiv \frac{g^{2}}{6 N_{c}} \operatorname{Im} \int_{-\infty}^{\infty} d s\left\langle\mathscr{T} E^{a, i}(s, \mathbf{0}) \mathscr{W}^{a b}[(s, \mathbf{0}),(0, \mathbf{0})] E^{b, i}(0, \mathbf{0})\right\rangle, \\
& \kappa_{\mathrm{adj}} \equiv \frac{g^{2}}{6 N_{c}} \operatorname{Re} \int_{-\infty}^{\infty} d s\left\langle\mathscr{T} E^{a, i}(s, \mathbf{0}) \mathscr{W}^{a b}[(s, \mathbf{0}),(0, \mathbf{0})] E^{b, i}(0, \mathbf{0})\right\rangle .
\end{aligned}
$$

## Quarkonium in the quantum optical limit

Semiclassical approximation

+ $M v \gg M v^{2}, T$ (Yao et al.)

$$
\frac{d n_{b}(t, \mathbf{x})}{d t}=-\Gamma^{\mathrm{diss}} n_{b}(t, \mathbf{x})+R^{\text {form }}(t, \mathbf{x})
$$

These correlators determine the dissociation and formation rates of quarkonia:

$$
\begin{aligned}
& \left.\Gamma^{\text {diss }} \propto \int \frac{\mathrm{d}^{3} \mathbf{p}_{\mathrm{rel}}}{(2 \pi)^{3}} \frac{\mathrm{~d}^{3} \mathbf{q}}{(2 \pi)^{3}}\left|\left\langle\psi_{\mathscr{B}}\right| \mathbf{r}\right| \Psi_{\mathbf{p}_{\text {rel }}}\right\rangle\left.\right|^{2}\left[g_{E}^{++}\right]_{i i}^{>}\left(q^{0}=E_{\mathscr{B}}-\frac{\mathbf{p}_{\text {rel }}^{2}}{M}, \mathbf{q}\right), \\
& \left.R^{\text {form }}(t, \mathbf{x}) \propto \int \frac{\mathrm{d}^{3} \mathbf{p}_{\mathrm{cm}}}{(2 \pi)^{3}} \frac{\mathrm{~d}^{3} \mathbf{p}_{\mathrm{rel}}}{(2 \pi)^{3}} \frac{\mathrm{~d}^{3} \mathbf{q}}{(2 \pi)^{3}}\left|\left\langle\psi_{\mathscr{B}}\right| \mathbf{r}\right| \Psi_{\mathbf{p}_{\text {rel }}}\right\rangle\left.\right|^{2}\left[g_{E}^{--}\right]_{i i}^{>}\left(q^{0}=\frac{\mathbf{p}_{\text {rel }}^{2}}{M}-E_{\mathscr{B}}, \mathbf{q}\right) \\
& \times f_{\mathcal{S}}\left(\mathbf{x}, \mathbf{p}_{\mathrm{cm}}, \mathbf{r}=0, \mathbf{p}_{\mathrm{rel}}, t\right) \text {. }
\end{aligned}
$$

# A comparison with heavy quark diffusion 

Different physics with the same building blocks

## Heavy quark diffusion

## an analogous picture

J. Casalderrey-Solana and D. Teaney, hep-ph/0605199

- The heavy quark diffusion coefficient is also defined from a correlation of chromoelectric fields:

$$
\begin{aligned}
& \left\langle\operatorname { T r } \left[\left(U_{[\infty, t]} E_{i}(t) U_{[t,-\infty)}\right)^{\dagger}\right.\right. \\
& \left.\left.\quad \times\left(U_{[\infty, 0]} E_{i}(0) U_{[0,-\infty)}\right)\right]\right\rangle
\end{aligned}
$$

- It reflects the typical momentum transfer $\left\langle p^{2}\right\rangle$ received from "kicks" from the medium.

## Heavy quark diffusion

## an analogous picture

J. Casalderrey-Solana and D. Teaney, hep-ph/0605199

- The heavy quark diffusion coefficient is also defined from a correlation of chromoelectric fields:

$$
\begin{aligned}

\end{aligned}
$$

- It reflects the typical momentum transfer $\left\langle p^{2}\right\rangle$ received from "kicks" from the medium.

## Heavy quark and quarkonia correlators

## a small, yet consequential difference

The heavy quark diffusion coefficient can be defined from the real-time

$$
\left\langle\operatorname{Tr}_{\text {color }}\left[U(-\infty, t) E_{i}(t) U(t, 0) E_{i}(0) U(0,-\infty)\right]\right\rangle_{T},
$$

whereas for quarkonia the relevant quantity is $\left(\mathbf{R}_{1}=\mathbf{R}_{2}\right.$ in the preceding discussion)

$$
T_{F}\left\langle E_{i}^{a}(t) \mathscr{W}^{a b}(t, 0) E_{i}^{b}(0)\right\rangle_{T} .
$$

## The difference in pQCD

## operator ordering is crucial!

Perturbatively, one can isolate the difference between the correlators to these diagrams.
$\Delta \rho(\omega)=\frac{g^{4} N_{c}^{2} C_{F} T_{F}}{4 \pi}|\omega|^{3}$

## The difference in pQCD

 operator ordering is crucial!

Perturbatively, one can isolate the difference between the correlators to these diagrams.

$$
\Delta \rho(\omega)=\frac{g^{4} N_{c}^{2} C_{F} T_{F}}{4 \pi}|\omega|^{3}
$$

The difference is due to different operator orderings (different possible gluon insertions).

## The difference in pQCD

 operator ordering is crucial!
$E$

Perturbatively, one can isolate the difference between the correlators to these diagrams.

$$
\Delta \rho(\omega)=\frac{g^{4} N_{c}^{2} C_{F} T_{F}}{4 \pi}|\omega|^{3}
$$

The difference is due to different operator orderings (different possible gluon insertions).

## The difference in pQCD

## Gauge invariant!

 operator ordering is crucial!

Perturbatively, one can isolate the difference between the correlators to these diagrams.

$$
\Delta \rho(\omega)=\frac{g^{4} N_{c}^{2} C_{F} T_{F}}{4 \pi}|\omega|^{3}
$$

The difference is due to different operator orderings (different possible gluon insertions).

## Can we calculate this difference non-perturbatively in QCD?

## A Lattice QCD perspective

## heavy quark diffusion

- The heavy quark diffusion coefficient has been studied by evaluating the following correlation function (e.g., Altenkort et al. 2009.13553, 2302.08501; Leino et al. 2212.10941):

$$
G_{\text {fund }}(\tau)=-\frac{1}{3} \frac{\left\langle\operatorname{ReTr}_{c}\left[U(\beta, \tau) g E_{i}(\tau) U(\tau, 0) g E_{i}(0)\right]\right\rangle}{\left\langle\operatorname{ReTr}_{c}[U(\beta, 0)]\right\rangle}
$$

- The heavy quark diffusion coefficient is extracted by reconstructing the corresponding spectral function (Caron-Huot et al. 0901.1195):

$$
G_{\text {fund }}(\tau)=\int_{0}^{+\infty} \frac{d \omega}{2 \pi} \frac{\cosh \left(\omega\left(\tau-\frac{1}{2 T}\right)\right)}{\sinh \left(\frac{\omega}{2 T}\right)} \rho_{\text {fund }}(\omega), \quad \kappa_{\text {fund }}=\lim _{\omega \rightarrow 0} \frac{T}{\omega} \rho_{\text {fund }}(\omega)
$$

## A Lattice QCD perspective

## quarkonium transport (hep-ph/2306.13127 w/ X. Yao)

- The quarkonium correlator in imaginary time has received less attention:

$$
G_{\mathrm{adj}}(\tau)=\frac{T_{F} g^{2}}{3 N_{c}}\left\langle E_{i}^{a}(\tau) \mathscr{W}^{a b}(\tau, 0) E_{i}^{b}(0)\right\rangle
$$

- The transport coefficients can also be extracted by spectral reconstruction:

$$
G_{\mathrm{adj}}(\tau)=\int_{-\infty}^{+\infty} \frac{\mathrm{d} \omega}{2 \pi} \frac{\exp \left(\omega\left(\frac{1}{2 T}-\tau\right)\right)}{2 \sinh \left(\frac{\omega}{2 T}\right)} \rho_{\mathrm{adj}}^{++}(\omega), \quad \kappa_{\mathrm{adj}}=\lim _{\omega \rightarrow 0} \frac{T}{2 \omega}\left[\rho_{\mathrm{adj}}^{++}(\omega)-\rho_{\mathrm{adj}}^{++}(-\omega)\right]
$$

- Main new ingredient: the spectral function $\rho_{\text {adj }}^{++}(\omega)$ is not odd under $\omega \rightarrow-\omega$, because $G_{\mathrm{adj}}(\tau)$ is not invariant under $\tau \rightarrow 1 / T-\tau$.

## In summary, we have:

$\square$ Understood the weakly coupled limit in QCD, and 2107.03945, 2205.04477
V formulated how to extract the transport coefficients in lattice QCD. 2306.13127

## However, the QGP is strongly coupled.

- Pending a lattice QCD determination, is there anything else we can learn at strong coupling?

Yes! Using holography, we can:
U Understand the strong coupling in $\mathcal{N}=4$ SYM, and
2304.03298

- calculate its velocity dependence. 2309.XXXXX

## Results in $\mathcal{N}=4$ SYM at strong coupling

## novel calculation in 2304.03298 with G . Nijs and X. Yao

$$
\kappa_{\mathrm{adj}}^{\mathcal{N}=4}+i \gamma_{\mathrm{adj}}^{\mathcal{N}=4} \equiv \frac{g^{2}}{6 N_{c}} \int_{-\infty}^{\infty} d s\left\langle\mathscr{T} E^{a, i}(s) \mathscr{W}_{[s, 0]}^{a b} b^{b, i}(0)\right\rangle=0
$$

## Results in $\mathcal{N}=4$ SYM at strong coupling

$$

## Velocity dependence of quarkonia transport rates in AdS/CFT 2309.xxxxX (w/G. Nijs and X. Yao)

$v$ : relative velocity between the rest frames of the QGP and the $Q \bar{Q}$ pair

$$
x_{\perp, \mathrm{QGP}}=x_{\perp, Q \bar{Q}}
$$

## Velocity dependence of quarkonia transport rates in AdS/CFT 2309.xxxxX (w/G. Nijs and X. Yao)

## Result:

The correlator has the same form as in the $v=0$ case, with

$$
T_{\mathrm{eff}, Q \bar{Q}}=\sqrt{\gamma} T_{\mathrm{QGP}},
$$

## Velocity dependence of quarkonia transport rates in AdS/CFT 2309.xxxxX (w/G. Nijs and X. Yao)

## Result:

The correlator has the same form as in the $v=0$ case, with $T_{\mathrm{eff}, Q \bar{Q}}=\sqrt{\gamma} T_{\mathrm{QGP}}$, where $\gamma=1 / \sqrt{1-v^{2}}$.

$v$ : relative velocity between the rest frames of

Same temperature dependence as the
$Q \bar{Q}$ potential in the same "hot wind" setup hep-ph/0612168

## A flavor of what we can do

 23XX.XXXXX (w/ X. Yao)We can now evolve a state of a heavy quark-antiquark pair, taking into account:

IV Their wavefunction evolution using a potential model, allowing for different initial separations $\sigma_{0}$ between the pair.
$\square$ Their transition rates via the correlator we just discussed.

## Summary and conclusions

- We have discussed how to calculate the chromoelectric correlators of the QGP that govern quarkonium transport.
- Interesting prospects for interpolating between weak \& strong coupling, and describing non-perturbative QGP physics.
- Next steps (as of Hard Probes 2023):
$\square$ Generalize the calculations to include a boosted medium.
$\square$ Calculate the chromo-magnetic correlators $\left\langle B^{a}(t) \mathscr{W}_{[t, 0]}^{a b} B^{b}(0)\right\rangle_{T}$.
$\square$ Use them as input for quarkonia transport codes.
- Stay tuned!

\end{aligned}
$$

## Open quantum systems "tracing/integrating out" the QGP

- Given an initial density matrix $\rho_{\text {tot }}(t=0)$, quarkonium coupled with the QGP evolves as

$$
\rho_{\mathrm{tot}}(t)=U(t) \rho_{\mathrm{tot}}(t=0) U^{\dagger}(t)
$$

- We will only be interested in describing the evolution of quarkonium and its final state abundances

$$
\Longrightarrow \rho_{S}(t)=\operatorname{Tr}_{\mathrm{QGP}}\left[U(t) \rho_{\mathrm{tot}}(t=0) U^{\dagger}(t)\right]
$$

- Then, one derives an evolution equation for $\rho_{S}(t)$, assuming that at the initial time we have $\rho_{\mathrm{tot}}(t=0)=\rho_{S}(t=0) \otimes e^{-H_{\mathrm{QGP}} / T} / \mathscr{L}_{\mathrm{QGP}}$.

## Open quantum systems

## "tracing/integrating out" the QGP: semi-classic description

## Lindblad equations for quarkonia at low $T \ll M v$ quantum Brownian motion limit \& quantum optical limit in pNRQCD

- After tracing out the QGP degrees of freedom, one gets a Lindblad-type equation:

$$
\frac{\partial \rho}{\partial t}=-i\left[H_{\mathrm{eff}}, \rho\right]+\sum_{j} \gamma_{j}\left(L_{j} \rho L_{j}^{\dagger}-\frac{1}{2}\left\{L_{j}^{\dagger} L_{j}, \rho\right\}\right)
$$

- This can be done in two different limits within pNRQCD:

Quantum Brownian Motion:
see works by

$$
\begin{array}{r}
\tau_{I} \gg \tau_{E} \\
\tau_{S} \gg \tau_{E}
\end{array}
$$

relevant for $M v \gg T \gg M v^{2}$

Quantum Optical:

$$
\begin{aligned}
& \tau_{I} \gg \tau_{E} \\
& \tau_{I} \gg \tau_{S}
\end{aligned}
$$

relevant for $M v \gg M v^{2}, T$

## Quantum Brownian Motion limit details

$$
\left.\begin{array}{c}
\frac{d \rho_{S}(t)}{d t}=-i\left[H_{S}+\Delta H_{S}, \rho_{S}(t)\right]+\kappa_{\mathrm{adj}}\left(L_{\alpha i} \rho_{S}(t) L_{\alpha i}^{\dagger}-\frac{1}{2}\left\{L_{\alpha i}^{\dagger} L_{\alpha i}, \rho_{S}(t)\right\}\right) \\
H_{S}=\frac{\mathbf{p}_{\mathrm{rel}}^{2}}{M}+\left(\begin{array}{cc}
-\frac{C_{F} \alpha_{s}}{r} & 0 \\
0 & \frac{\alpha_{s}}{2 N_{c} r}
\end{array}\right), \quad \Delta H_{S}=\frac{\gamma_{\mathrm{adj}}}{2} r^{2}\left(\begin{array}{cc}
1 & 0 \\
0 & \frac{N_{c}^{2}-2}{2\left(N_{c}^{2}-1\right)}
\end{array}\right) \\
L_{1 i}
\end{array}\right)=\left(r_{i}+\frac{1}{2 M T} \nabla_{i}-\frac{N_{c}}{8 T} \frac{\alpha_{s} r_{i}}{r}\right)\left(\begin{array}{ll}
0 & 0 \\
1 & 0
\end{array}\right) .
$$

## Heavy quark and quarkonia correlators

## a small, yet consequential difference

A. M. Eller, J. Ghiglieri and G. D. Moore, hep-ph/1903.08064

What we just found, and had been noticed even earlier by Eller, Ghiglieri and Moore, is simply stating that:
Y. Burnier, M. Laine, J. Langelage and L. Mether, hep-ph/1006.0867

$$
T_{F}\left\langle E_{i}^{a}(t) \mathscr{W}^{a b}(t, 0) E_{i}^{b}(0)\right\rangle_{T} \neq\left\langle\operatorname{Tr}_{\text {color }}\left[U(-\infty, t) E_{i}(t) U(t, 0) E_{i}(0) U(0,-\infty)\right]\right\rangle_{T}
$$

## An axial gauge puzzle an apparent (but not actual) inconsistency

- This finding presents a puzzle:
- Let's say we were able to set axial gauge $A_{0}=0$.
- Then, the two correlation functions would look the same:

$$
T_{F}\left\langle E_{i}^{a}(t) E_{i}^{a}(0)\right\rangle_{T}=\left\langle\operatorname{Tr}_{\text {color }}\left[E_{i}(t) E_{i}(0)\right]\right\rangle_{T}
$$

- If true, this would imply that:
A. one of the calculations is wrong, or
B. one of the correlators is not garuge invariant.

## An axial gauge puzzle an apparent (but not actual) inconsistency

- This finding presents a puzzle:
- Let's say we were able to set axial gauge $A_{0}=0$.
- Then, the two correlation functions would look the same:

$$
T_{F}\left\langle E_{i}^{a}(t) E_{i}^{a}(0)\right\rangle_{T}=\left\langle\operatorname{Tr}_{\text {color }}\left[E_{i}(t) E_{i}(0)\right]\right\rangle_{T}
$$

- If true, this would imply that:
A. one of the calculations is wrong, or

Unlikely: we verified this independently
B. one of the correlators is not gazuge invariant.

## An axial gauge puzzle an apparent (but not actual) inconsistency

- This finding presents a puzzle:
- Let's say we were able to set axial gauge $A_{0}=0$.
- Then, the two correlation functions would look the same:

$$
T_{F}\left\langle E_{i}^{a}(t) E_{i}^{a}(0)\right\rangle_{T}=\left\langle\operatorname{Tr}_{\text {color }}\left[E_{i}(t) E_{i}(0)\right]\right\rangle_{T}
$$

- If true, this would imply that:
A. one of the calculations is wrong, or

Unlikely: we verified this independently
B. one of the correlators is not gauge invariant.

False: both definitions are explicitly invariant

## An axial gauge puzzle an apparent (but not actual) inconsistency

- This finding presents a puzzle:
- Let's say we were able to set axial gauge $A_{0}=0 . \Longrightarrow$ The problem is here
- Then, the two correlation functions would look the same:

$$
T_{F}\left\langle E_{i}^{a}(t) E_{i}^{a}(0)\right\rangle_{T}=\left\langle\operatorname{Tr}_{\text {color }}\left[E_{i}(t) E_{i}(0)\right]\right\rangle_{T}
$$

o If true, this would imply that:
A. one of the calculations is wrong, or

Unlikely: we verified this independently
B. one of the correlators is not gauge invariant. $\qquad$ False: both definitions are explicitly invariant

## BS and X. Yao, hep-ph/2205.04477

## An axial gauge puzzle an apparent (but not actual) incons

We verified that this difference between
the correlators is gauge invariant using an interpolating gauge condition:

$$
G_{M}^{a}[A]=\frac{1}{\lambda} A_{0}^{a}(x)+\partial^{\mu} A_{\mu}^{a}(x)
$$

- This finding presents a puzzle:
- Let's say we were able to set axial gauge $A_{0}=0 . \Longrightarrow$ The problem is here
- Then, the two correlation functions would look the same:

$$
T_{F}\left\langle E_{i}^{a}(t) E_{i}^{a}(0)\right\rangle_{T}=\left\langle\operatorname{Tr}_{\text {color }}\left[E_{i}(t) E_{i}(0)\right]\right\rangle_{T}
$$

o If true, this would imply that:
A. one of the calculations is wrong, or
B. one of the correlators is not gauge invariant. $\qquad$ False: both definitions are explicitly invariant

## Wilson loops in AdS/CFT

## setup

- The holographic duality provides a way to formulate the calculation of analogous correlators in strongly coupled theories. [ $\left.{ }^{* *}\right]$
- Wilson loops can be evaluated by solving classical equations of motion:

$$
\langle W[\mathscr{C}=\partial \Sigma]\rangle_{T}=e^{i S_{\mathrm{NC}}[\Sigma]}
$$

## How do Wilson loops help?

## setup - pure gauge theory

- Field strength insertions along a Wilson loop can be generated by taking variations of the path $\mathscr{C}$ :
$\left.\frac{\delta}{\delta f^{\mu}\left(s_{2}\right)} \frac{\delta}{\delta f^{\nu}\left(s_{1}\right)} W\left[\mathscr{C}_{f}\right]\right|_{f=0}=(i g)^{2} \operatorname{Tr}_{\text {color }}\left[U_{\left[1, s_{2}\right]} F_{\mu \rho}\left(\gamma\left(s_{2}\right)\right) \dot{\gamma}^{\rho}\left(s_{2}\right) U_{\left[s_{2}, s_{1}\right]} F_{\nu \sigma}\left(\gamma\left(s_{1}\right)\right) \dot{\gamma}^{\sigma}\left(s_{1}\right) U_{\left[s_{1}, 0\right]}\right]$

## How do Wilson loops help?

## setup - pure gauge theory

- Field strength insertions along a Wilson loop can be generated by taking variations of the path $\mathscr{C}$ :
$\left.\frac{\delta}{\delta f^{\mu}\left(s_{2}\right)} \frac{\delta}{\delta f^{\nu}\left(s_{1}\right)} W\left[\mathscr{C}_{f}\right]\right|_{f=0}=(i g)^{2} \operatorname{Tr}_{\text {color }}\left[U_{\left[1, s_{2}\right]} F_{\mu \rho}\left(\gamma\left(s_{2}\right)\right) \dot{\gamma}^{\rho}\left(s_{2}\right) U_{\left[s_{2}, s_{1}\right]} F_{\nu \sigma}\left(\gamma\left(s_{1}\right)\right) \dot{\gamma}^{\sigma}\left(s_{1}\right) U_{\left[s_{1}, 0\right]}\right]$
- Same as the lattice calculation of the heavy quark diffusion coefficient:

## Wilson loops in AdS/CFT

## setup

- The holographic duality provides a way to formulate the calculation of analogous correlators in strongly coupled theories. [**]
- Wilson loops can be evaluated by solving classical equations of motion:

$$
\langle W[\mathscr{C}=\partial \Sigma]\rangle_{T}=e^{i S_{\mathrm{NG}}[\Sigma]}
$$

Metric of interest for finite $T$ calculations:

$$
d s^{2}=\frac{R^{2}}{z^{2}}\left[-f(z) d t^{2}+d \mathbf{x}^{2}+\frac{1}{f(z)} d z^{2}+z^{2} d \Omega_{5}^{2}\right]
$$

$$
f(z)=1-(\pi T z)^{4}
$$

## Wilson loops in $\mathcal{N}=4$ SYM

## a slightly different observable

- A holographic dual in terms of an extremal surface exists for

$$
W_{\mathrm{BPS}}[\mathscr{C} ; \hat{n}]=\frac{1}{N_{c}} \operatorname{Tr}_{\text {color }}\left[\mathscr{P} \exp \left(i g \oint_{\mathscr{C}} d s T^{a}\left[A_{\mu}^{a} \dot{x}^{\mu}+\hat{n}(s) \cdot \overrightarrow{\phi^{a}} \sqrt{\dot{x}^{2}}\right]\right)\right]
$$

which is not the standard Wilson loop.

## Wilson loops in $\mathcal{N}=4$ SYM

## a slightly different observable

- A holographic dual in terms of an extremal surface exists for

$$
W_{\mathrm{BPS}}[\mathscr{C} ; \hat{n}]=\frac{1}{N_{c}} \operatorname{Tr}_{\text {color }}\left[\mathscr{P} \exp \left(i g \oint_{\mathscr{C}} d s T^{a}\left[A_{\mu}^{a} \dot{x}^{\mu}+\hat{n}(s) \cdot \overrightarrow{\phi^{a}} \sqrt{\dot{x}^{2}}\right]\right)\right]
$$

which is not the standard Wilson loop.

- $\mathcal{N}=4$ SYM has 6 scalar fields $\vec{\phi}^{a}$, which enter the above Wilson loop through a direction $\hat{n} \in S_{5}$. Also, its dual gravitational description is $\mathrm{AdS}_{5} \times \mathrm{S}_{5}$.

## Wilson loops in $\mathcal{N}=4$ SYM

## a slightly different observable

- A holographic dual in terms of an extremal surface exists for

$$
W_{\mathrm{BPS}}[\mathscr{C} ; \hat{n}]=\frac{1}{N_{c}} \operatorname{Tr}_{\text {color }}\left[\mathscr{P} \exp \left(i g \oint_{\mathscr{C}} d s T^{a}\left[A_{\mu}^{a} \dot{x}^{\mu}+\hat{n}(s) \cdot \overrightarrow{\phi^{a}} \sqrt{\dot{x}^{2}}\right]\right)\right]
$$

which is not the standard Wilson loop.

- $\mathcal{N}=4$ SYM has 6 scalar fields $\overrightarrow{\phi^{a}}$, which enter the above Wilson loop through a direction $\hat{n} \in S_{5}$. Also, its dual gravitational description is $\mathrm{AdS}_{5} \times \mathrm{S}_{5}$.
- What to do with this extra parameter? For a single heavy quark, just set $\hat{n}=\hat{n}_{0}$.

## Choosing $\hat{n}$

## what is the best proxy for an adjoint Wilson line?

- A key property of the adjoint Wilson line is

$$
\mathscr{W}_{\left[t_{2}, t_{1}\right]}^{a b}=\frac{1}{T_{F}} \operatorname{Tr}\left[\mathscr{T}\left\{T^{a} U_{\left[t_{2}, t_{1}\right]} T^{b} U_{\left[t_{2}, t_{1}\right]}^{\dagger}\right\}\right],
$$

which means that we can obtain the correlator we want by studying deformations of a Wilson loop of the form $W=\frac{1}{N_{c}} \operatorname{Tr}\left[U U^{\dagger}\right]=1$.

- This leads us to consider the following loop:

$$
\hat{n}=\hat{n}_{0}
$$

$$
\hat{n}=-\hat{n}_{0}
$$

# The Schwinger-Keldysh contour 

 quarkonia and heavy quarks

# The Schwinger-Keldysh contour <br> <br> quarkonia and heavy quarks 

 <br> <br> quarkonia and heavy quarks}

- The heavy quark is present at all times:
- It is part of the construction of the thermal state.
- The Wilson line, which enforces the Gauss' law constraint due to the point charge, is also present on the Euclidean segment.

# The Schwinger-Keldysh contour 

## quarkonia and heavy quarks

$$
\operatorname{Re}\{t\}
$$

- In this correlator, the heavy quark pair is present at all times, but it is only color-charged for a finite time:
- It is not part of the construction of the thermal state.
- The adjoint Wilson line, representing the propagation of unbound quarkonium (in the adjoint representation), is only present on the real-time segment.

## Review: Heavy Quark Diffusion in AdS/CFT

 using the same computational techniqueSteps of the calculation:

1. Find the appropriate background solution

AdS/Schwarzschild black hole
time-ordered branch of SK
$\Sigma$
 SK contour

## Review: Heavy Quark Diffusion in AdS/CFT

 using the same computational techniqueSteps of the calculation:

1. Find the appropriate background solution
2. Introduce perturbations

## Review: Heavy Quark Diffusion in AdS/CFT

 using the same computational techniqueSteps of the calculation:

1. Find the appropriate background solution
2. Introduce perturbations
3. Evaluate the deformed Wilson loop and take derivatives
From here: $\kappa=\pi \sqrt{g^{2} N_{c}} T^{3}$
 SK contour

## Quarkonium correlator in AdS/CFT

a very similar picture

- Same steps as before:

1. Find background solution
2. Introduce perturbations
3. Evaluate the derivatives

- Differences:
- Boundary conditions
- Time-ordered correlator; not retarded

## SK contour and Holography

## Heavy quark correlator

$$
\xrightarrow{\operatorname{Im}\{t\}} \operatorname{Re}\{t\}
$$

Fluctuations are matched through the imaginary time segment solving the equations of motion $\Longrightarrow$ factors of $e^{\beta \omega}, \mathrm{KMS}$ relations $\downarrow_{z}$

## SK contour and Holography

## Heavy quark correlator

$$
\xrightarrow{\operatorname{Im}\{t\}}
$$

Fluctuations are matched through the imaginary time segment solving the equations of motion $\Longrightarrow$ factors of $e^{\beta \omega}, \mathrm{KMS}$ relations $\downarrow_{z}$

$$
t=t_{i}
$$

$$
t=t_{i}-i \beta
$$

$$
\text { From here: } \kappa=\pi \sqrt{g^{2} N_{c}} T^{3}
$$

## SK contour and Holography

## Quarkonium correlator

Fluctuations are matched at the turnaround points of the extremal surface. No direct sensitivity to the imaginary time segment.

sure No direc sensivity to

$$
t=t_{i}
$$

$$
\hat{n}=-\hat{n}_{0}
$$

## How the calculation proceeds

## what equations do we need to solve?

- The classical, unperturbed equations of motion from the Nambu-Goto action to determine $\Sigma$ :

$$
S_{\mathrm{NG}}=-\frac{1}{2 \pi \alpha^{\prime}} \int d \tau d \sigma \sqrt{-\operatorname{det}\left(g_{\mu \nu} \partial_{\alpha} X^{\mu} \partial_{\beta} X^{\nu}\right)} .
$$

- The classical, linearized equation of motion with perturbations in order to be able to calculate derivatives of $\left\langle W\left[\mathscr{C}_{f}\right]\right\rangle_{T}=e^{i S_{\mathrm{NG}}\left[\Sigma_{f}\right]}$ :

$$
S_{\mathrm{NG}}\left[\Sigma_{f}\right]=S_{\mathrm{NG}}[\Sigma]+\left.\int d t_{1} d t_{2} \frac{\delta^{2} S_{\mathrm{NG}}\left[\Sigma_{f}\right]}{\delta f\left(t_{1}\right) \delta f\left(t_{2}\right)}\right|_{f=0} f\left(t_{1}\right) f\left(t_{2}\right)+O\left(f^{3}\right)
$$

- In practice, the equations are only numerically stable in Euclidean signature, so we have to solve them and analytically continue back.

## QGP chromoelectric correlators

for quarkonia transport

$$
\left[g_{E}^{++}\right]_{i_{2} i_{1}}^{>}\left(t_{2}, t_{1}, \mathbf{R}_{2}, \mathbf{R}_{1}\right)=\left\langle\left(E_{i_{2}}\left(\mathbf{R}_{2}, t_{2}\right) \mathscr{W}_{2}\right)^{a}\left(\mathscr{W}_{1} E_{i_{1}}\left(\mathbf{R}_{1}, t_{1}\right)\right)_{4_{2}}^{a}\right\rangle_{T}
$$

## The spectral function of quarkonia

## symmetries and KMS relations

The KMS conjugates of the previous correlators are such that

$$
\left[g_{E}^{++}\right]_{j i}^{>}(q)=e^{q^{0} / T}\left[g_{E}^{++}\right]_{j i}^{<}(q), \quad\left[g_{E}^{--}\right]_{j i}^{>}(q)=e^{q^{0} / T}\left[g_{E}^{--}\right]_{j i}^{<}(q),
$$

and one can show that they are related by

$$
\left[g_{E}^{++}\right]_{j i}^{>}(q)=\left[g_{E}^{--}\right]_{j i}^{<}(-q), \quad\left[g_{E}^{--}\right]_{j i}^{>}(q)=\left[g_{E}^{++}\right]_{j i}^{<}(-q) .
$$

The spectral functions $\left[\rho_{E}^{++/--}\right]_{j i}(q)=\left[g_{E}^{++/--}\right]_{j i}^{>}(q)-\left[g_{E}^{++/--}\right]_{j i}^{<}(q)$ are not necessarily odd under $q \leftrightarrow-q$. However, they do satisfy:

$$
\left[\rho_{E}^{++}\right]_{j i}(q)=-\left[\rho_{E}^{--}\right]_{j i}(-q) .
$$
