## New opportunities for understanding high-density QCD matter with CMS Phase II detector at the High-Luminosity LHC era

*Wednesday 6 September 2023 11:00 (20 minutes)*

The intriguing phenomena emerging in the high-density quantum chromodynamics (QCD) matter are being widely studied in the heavy ion program at the LHC and will be understood more deeply during the high-luminosity LHC (HL-LHC) era. The CMS experiment is under the Phase II upgrade towards the HL-LHC era. A new timing detector is proposed with its timing resolution for minimum ionization particles (MIP) to be 30 ps. The MIP timing detector (MTD) will also provide the particle identification (PID) ability with a large pseudorapidity acceptance covering up to  $|\eta| < 3$  through time-of-flight (TOF). Combining MTD with the other new subdetectors, i.e., a tracker with acceptance  $|\eta| < 4$  and high-granularity calorimeters with acceptance  $|\eta| < 5$ , will enable deeper studies of high-density QCD matters in ultrarelativistic heavy ion collisions. In this presentation, the performances of a broad range of measurements in the future CMS heavy ion programs will be discussed using TOF-PID. These include the (3+1)-dimensional evolution of heavy flavor quarks, QGP medium response to high transverse momentum parton energy loss at wide jet cone angles, collectivity in small systems, fluctuations and transport of initially conserved charges, and light nuclei physics.

### Category

Experiment

### Collaboration (if applicable)

CMS
