

INFN-CNAF T1

Quattor status

Andrea Chierici

12 March 2007

Situation

- Running slc3
- Storage people require slc4 (32bit)
- Standard quattor release 1.2 (no QWG)
- Implemented “home” solution for NS
 - Added ACLs to limit access to some core templates
 - Some problems in the beginning but now well accepted
- Worked with “Italian Grid release team” to have quattor templates (rpms lists) in sync with (standard) apt+yaim release

Future

- Upgrade to latest quattor version
 - Main problem is man power
- Migrate to new NS
 - Difficult migration process particularly for storage nodes
- New blade farm will be installed soon
 - New All component REQUIRED to deal the problem of megaraid devices (/dev/cciss/c0d0)
- Xen under study. Component is really welcome!
