

# NuFact'11 XIIIth Workshop on Neutrino Factories, Superbeams and Beta-beams

Monday 01 August 2011 - Saturday 06 August 2011

## Book of Abstracts

# Contents

Welcome address by CERN Director 0 . . . . .	1
Registration 1 . . . . .	1
Experimental Status of Neutrino Physics 2 . . . . .	1
relative performance of neutrino facilities 3 . . . . .	1
Accelerators for Future Neutrino Facilities: strengths & challenges 4 . . . . .	1
Scientific goals of the workshop 5 . . . . .	1
Working Groups conveners: achievements and questions 6 . . . . .	2
Beaming neutrino across the Earth to Deep Core to test neutrino mixing parameters and CPT violation 7 . . . . .	2
WG1 Daya Bay's First Experimental Hall Coming On Line 8 . . . . .	2
WG3 neutrino flux monitoring in the neutrino factory 9 . . . . .	3
Poster "Dissipative Effects in Neutrino Oscillation" 10 . . . . .	3
The Very-Low-Energy Neutrino Factory 11 . . . . .	3
Low Energy Signatures of the TeV Scale See-Saw Mechanism 12 . . . . .	4
Large Extra Dimensions, Neutrino Oscillations and the Reactor Antineutrino Anomaly 13	4
The Daya Bay Neutrino Experiment: An Overview 14 . . . . .	4
Welcome - CERN 15 . . . . .	5
WG1 conveners: set the scene 16 . . . . .	5
WG2 conveners: set the scene 17 . . . . .	5
WG3 conveners: set the scene 18 . . . . .	5
WG4 conveners: set the scene 19 . . . . .	5
Can LHC physics shed light on the neutrino paradigm? 20 . . . . .	6
Future Neutrino Facilities in the Global Physics Environment 21 . . . . .	6
Neutrinos and the Universe 22 . . . . .	6

T2K Results and Future Plans 23 . . . . .	6
CNGS: Overview and Future Prospects 24 . . . . .	7
MINOS, MINOS+, NOvA: Overview and Future Prospects 25 . . . . .	7
Challenges of Future Neutrino Oscillation Physics 26 . . . . .	7
Neutrino Masses and Mixing vs Grand Unified Theories 27 . . . . .	7
Accelerator Based Neutrino Oscillation Projects in Japan Beyond T2K 28 . . . . .	7
Long-baseline Neutrino Beam Options at CERN 29 . . . . .	8
Long-Baseline Neutrino Beams at FNAL 30 . . . . .	8
(M)MW Target and Horn for Neutrino Super-Beams 31 . . . . .	8
Review of Present ant Future Reactor Neutrino Experiments 32 . . . . .	8
Phenomenology of Sterile Neutrinos 33 . . . . .	8
An Experiment at the CERN PS Neutrino Beam 34 . . . . .	9
Future Short-baseline Physics at FermiLab 35 . . . . .	9
WG2 Optical Systems for Liquid Argon TPC Detectors 36 . . . . .	9
Future RandD Experiments for SB, NF & BB 37 . . . . .	10
Impact of Neutrino Scattering Physics on Neutrino Oscillation Experiments 38 . . . . .	10
Detectors for the Next Generation of Neutrino Beams 39 . . . . .	10
Beam Monitoring and Near Detector Requirements for a NF or LBL beams 40 . . . . .	10
Status of Neutrino Factory Accelerator Design Studies 41 . . . . .	10
MICE & MUCOOL Experiments - Status and Prospects 42 . . . . .	10
Multi-MW Target and Capture Design for NF 43 . . . . .	11
EMMA - Recent Developments 44 . . . . .	11
Neutrino Physics Within and Beyond the Three Flavor Oscillation 45 . . . . .	11
Ion Production for Beta-beams 47 . . . . .	11
Proton Drivers for Neutrino Beams and Other High-Intensity Applications 48 . . . . .	11
Prospects for CLFV Experiments 49 . . . . .	12
Towards a Muon Collider 50 . . . . .	12
WG1 - Summary Report 51 . . . . .	12
WG2 - Summary Report 52 . . . . .	12
WG3 - Summary Report 53 . . . . .	12

WG4 - Summary Report 54 . . . . .	12
Workshop Summary Talk 55 . . . . .	13
Welcome - University of Geneva 56 . . . . .	13
Physics & Music Public Evening 57 . . . . .	13
Evening Public Lecture (in French) 58 . . . . .	13
Neutrino Factory Front End and Extensions 59 . . . . .	13
WG2 Gamma-ray production in NC interactions 60 . . . . .	14
The SuperBeam plus Beta Beam Combination 61 . . . . .	14
Neutrinoless double beta decay in seesaw models (talk@WG1) 62 . . . . .	14
Axial and Vector Structure Functions for Lepton-Nucleon Scattering 63 . . . . .	15
WG2 Neutrino interaction measurements using T2K Near Detectors 64 . . . . .	15
WG1 talk: NonStandard Interactions at LEP or the LHC? 65 . . . . .	16
Performance of the T2K Near Detectors 66 . . . . .	16
Minerva First Results and Future Goals 67 . . . . .	16
Study of sterile neutrino mixing in low energy neutrino factory 68 . . . . .	17
First measurements of muon production rate using a novel pion capture system at MuSIC 69 . . . . .	17
WG1: Optimisation of the Low-Energy Neutrino Factory 70 . . . . .	17
Minimal models with light sterile neutrinos 71 . . . . .	18
Proton Drivers for Neutrino Beams and Other High-Intensity Applications 72 . . . . .	18
A new lattice for the beta-beam decay ring to enlarge the stability limit 73 . . . . .	19
WG4 The Final Measurement of the Muon Decay Parameters from the TWIST Experiment 74 . . . . .	19
WG2: MINERvA Reconstruction and Operations Status 75 . . . . .	20
POSTER Modeling neutrino-nucleus interactions in the few-GeV regime 76 . . . . .	20
Measurement of CCQE cross section with T2K on-axis neutrino detector Proton Module 77	20
WG1 Initial Performance from the NOvA Surface Prototype Detector 78 . . . . .	21
Development of the superconducting solenoid for the MuHFS experiment at J-PARC 79 .	21
WG1 Determination of Neutrino Mass Hierarchy with T2K and NOvA 80 . . . . .	22
WG4 J-PARC MUSE H-line optimization for the g-2 and MuHFS experiments 81 . . . . .	23

WG4 MuHFS experiment at J-PARC 83 . . . . .	23
WG3 Performance Comparison Between FSIA and Bucked Coils for the Neutrino Factory Cooling Lattice 84 . . . . .	24
WG2 Status of the MIND Simulation and Analysis 85 . . . . .	24
CERN to Fréjus Super Beam, New Design (poster) 86 . . . . .	24
Recent developments on the muon Non-Scaling FFAG for the Neutrino Factory and its subsystems 87 . . . . .	25
Alternative designs for Non-Scaling FFAGs for muon acceleration in the Neutrino Factory 88 . . . . .	25
Recent Studies on the PRISM FFAG Ring 89 . . . . .	25
WG1 Optimized Neutrino Factory for small and large $\theta_{13}$ 90 . . . . .	26
Feasibility experiment Of Granular Target Options for Future Neutrino Facilities 91 . . .	26
Neutrino Factory Target and Capture System Optimization Studies 92 . . . . .	27
MiniBooNE cross section results 93 . . . . .	27
SciBooNE 94 . . . . .	27

## Welcome address by CERN Director

**Corresponding Author:** rolf.heuer@cern.ch

Plenary / 1

## Registration

For last minute participants only.  
The desk will be closed 10min before the session starts.

Plenary / 2

## Experimental Status of Neutrino Physics

**Author:** Dave Wark<sup>1</sup>

**Co-authors:** Fanny Dufour<sup>2</sup>; Gersende Prior<sup>3</sup>

<sup>1</sup> RAL / Imperial College London

<sup>2</sup> Geneva University

<sup>3</sup> Universite de Geneve (CH)

**Corresponding Authors:** david.wark@stfc.ac.uk, fanny.dufour@unige.ch, gersende.prior@cern.ch

3

## relative performance of neutrino facilities

Plenary / 4

## Accelerators for Future Neutrino Facilities: strengths & challenges

**Author:** Michael Zisman<sup>1</sup>

**Co-author:** Ilias Efthymiopoulos<sup>2</sup>

<sup>1</sup> Lawrence Berkeley National Laboratory

<sup>2</sup> CERN

**Corresponding Authors:** mszisman@lbl.gov, ilias.efthymiopoulos@cern.ch

Plenary / 5

## Scientific goals of the workshop

**Corresponding Author:** alain.blondel@cern.ch

6

## Working Groups conveners: achievements and questions

each WG convener will present in 10 minutes the achievements of the previous years and the open questions.

7

## Beaming neutrino across the Earth to Deep Core to test neutrino mixing parameters and CPT violation

**Author:** Daniele Fargion<sup>1</sup>

**Co-author:** Daniele D'Armiento<sup>2</sup>

<sup>1</sup> *Physics Department, Rome University 1 and INFN Rome*

<sup>2</sup> *Physics Departm.*

**Corresponding Author:** daniele.fargion@roma1.infn.it

Twenty GeV Neutrino crossing along the Earth by longest base line (CERN-Deep Core or FNL-Deep Core) offer the most powerful tool to test neutrino (muon-tau) mixing masses and angles. An Opera-like experiment at 1% size and flux may lead to a few hundreds events a year of tau appearance or and muon suppression or disappearance. The large (11000 km) distance neutrino flux dilution is widely overcome by largest (tens Megaton) Deep Core mass and by a complete oscillation conversion. A sharp and silent atmospheric neutrino experiment may provide a test also to Minos like CPT violation claim.

8

## WG1 Daya Bay's First Experimental Hall Coming On Line

**Author:** Zhimin Wang<sup>1</sup>

<sup>1</sup> *Institute of high energy physics, Beijing*

**Corresponding Author:** wangzhm@ihep.ac.cn

The Daya Bay reactor neutrino experiment is designed to measure the last unknown neutrino mixing angle  $\theta_{13}$  with a sensitivity of  $\sin^2 2\theta_{13} < 0.01$  through a measurement of the relative rates and energy spectra of reactor antineutrinos at different baselines. Eight identical liquid scintillator antineutrino detectors (ADs) will be installed in three experimental halls. The first experimental hall, Daya Bay near site, will come on line in this summer, which is  $\sim 360$ m away from Daya Bay reactors and has 98m rock overburden, where two ADs will be installed in a water pool with at least 2.5m water shielding. 840 antineutrino events per AD per day are detected with 20-ton target mass. The water pool is divided into inner and outer parts and equipped with PMTs to

serve as Cherenkov detector. Resistive Plate Chambers (RPCs) covers the water pool to provide additional Muon tagging. We will describe the design, construction, commissioning and preliminary performance of the Daya Bay detectors.

### WG3 Accelerator Physics / 9

## WG3 neutrino flux monitoring in the neutrino factory

**Author:** Alain Blondel<sup>1</sup>

<sup>1</sup> *DPNC*

**Corresponding Author:** alain.blondel@cern.ch

The presentation will summarize the beam controls necessary to refine the flux in the neutrino factory with a precision of 10<sup>-3</sup>. A polarimeter, a beam divergence measurement and a beam current measurement will do the job

10

## Poster "Dissipative Effects in Neutrino Oscillation"

**Author:** Roberto Oliveira<sup>1</sup>

**Co-author:** Marcelo Guzzo<sup>1</sup>

<sup>1</sup> *Universidade Estadual de Campinas*

**Corresponding Author:** robertol@ifi.unicamp.br

We study neutrino oscillation taking into account the interaction with environment where open quantum system approach is rigorously used. This changes the usual pattern of oscillation because decoherence and relaxation effects can occur in the subsystem of neutrinos. These dissipative effects are added with only one phenomenological parameter constrained by complete positivity evolution. In terms of Majorana neutrinos, the oscillation probabilities can exhibit, even for two flavor neutrinos, a CP-violation effect in vacuum and matter. Both vacuum and matter effects are derived and presented in this work. We compare the obtained probabilities in vacuum with MINOS data. We estimate a limit to the phenomenological dissipative parameter and to the CP Majorana phase. Also, a genuine dissipative effect to three families is presented.

11

## The Very-Low-Energy Neutrino Factory

**Author:** Alan Bross<sup>1</sup>

**Co-authors:** Charles Ankenbrandt<sup>2</sup>; David Neuffer<sup>1</sup>; Milorad Popovic<sup>1</sup>

<sup>1</sup> *Fermilab*

<sup>2</sup> *Muons Inc./Fermilab*

**Corresponding Author:** bross@fnal.gov

Recent results from MiniBooNE and new calculations regarding the anti-neutrino flux from reactors provide exciting new motivation to study neutrino oscillations physics

at L/E  $\approx 1$ . Using a targeting system similar to the one used for MiniBooNE and a muon storage/decay ring with central E of  $\approx 1.5$  GeV gives the capability to measure electron neutrino disappearance with 1% precision using a suitably designed near detector and the MiniBooNE detector as the far detector. This talk will describe the overall concept including targeting, collection and ring design and will give estimated event rates (based on MiniBooNE as the far detector). Finally, we will describe some possible near detector configurations and far detector options.

12

## Low Energy Signatures of the TeV Scale See-Saw Mechanism

**Author:** Alejandro Ibarra<sup>1</sup>

**Co-author:** Gersende Prior<sup>2</sup>

<sup>1</sup> TUM

<sup>2</sup> Universite de Geneve (CH)

**Corresponding Authors:** alejandro.ibarra@ph.tum.de, gersende.prior@cern.ch

We study the phenomenological consequences of the type I see-saw model, when the right-handed neutrinos have masses at the electroweak scale. Concretely, we discuss the prospects to produce and detect the right-handed neutrinos at colliders in view of the present constraints from electroweak precision observables and rare muon decays. We find that the most promising experiments to observe the first signatures of such models are the searches for lepton flavour violation and for neutrinoless double beta decay.

13

## Large Extra Dimensions, Neutrino Oscillations and the Reactor Antineutrino Anomaly

**Authors:** Fábio Alex Pereira dos Santos<sup>1</sup>; Hiroshi Nunokawa<sup>1</sup>; Pedro Machado<sup>2</sup>; Renata Zukanovich Funchal<sup>3</sup>

<sup>1</sup> PUC-Rio

<sup>2</sup> University of São Paulo and CEA-Saclay

<sup>3</sup> University of São Paulo

**Corresponding Author:** accioly@fma.if.usp.br

We consider a model where sterile neutrinos can propagate in a large compactified extra dimension giving rise to Kaluza-Klein (KK) modes and the Standard Model left-handed neutrinos are confined to a 4-dimensional spacetime brane. The KK modes mix with the standard neutrinos modifying their oscillation pattern. To set limits on and estimate sensitivities to the size of the largest extra dimension, we examine former, current and future experiments. We also investigate the recent reactor antineutrino anomaly in this context.

14

## The Daya Bay Neutrino Experiment: An Overview

**Author:** Jianglai Liu<sup>1</sup>

<sup>1</sup> *Shanghai Jiao Tong University*

**Corresponding Author:** jianglai.liu@sjtu.edu.cn

The phenomenon of neutrino flavor oscillations is now well-established. Mixing among the three flavors is characterized by three mixing angles, with  $\theta_{13}$  being the only presently unknown angle. A precise measurement of  $\theta_{13}$  can be made by utilizing a powerful nuclear reactor as the anti-neutrino source, going deep underground to reduce the background, and building “identical” near and far detectors to minimize the systematics. We are building such an experiment at the Daya Bay nuclear power plant in south China. This project, known as the Daya Bay Neutrino Experiment, is making steady progress. The civil construction and the detector assembly are underway, and we expect to start data taking in the first near experimental hall this summer. In this talk, I will stress the physics motivation of such a measurement, introduce you to the world of making precise oscillation measurement with reactor neutrinos, and look into the near future of the Daya Bay experiment.

## Can LHC physics shed light on the neutrino paradigm?

**Corresponding Author:** goran@ictp.trieste.it

I argue that LHC may shed light on the nature of neutrino mass through the probe of the seesaw mechanism. The smoking gun signature is lepton number violation through the production of same sign lepton pairs, a collider analogy of the neutrinoless double beta decay. I discuss this in the context of L-R symmetric theories, which predicted neutrino mass long before experiment and led to the seesaw mechanism. A WR gauge boson with a mass in a few TeV region could easily dominate neutrinoless double beta decay, and its discovery at LHC would have spectacular signatures of parity restoration and lepton number violation.

I also discuss the collider signatures of the three types of seesaw mechanism, and show how in the case of Type II one can measure the PMNS mixing matrix at the LHC, complementing the low energy probes. Finally, I give an example of a simple realistic SU(5) grand unified theory that predicts the hybrid Type I + III seesaw with a weak fermion triplet at the LHC energies.

## Future Neutrino Facilities in the Global Physics Environment

**Corresponding Author:** john.ellis@cern.ch

Round table discussion following the PH seminar.

The panel composed of the following members

- S. Bertolucci (CERN)
- K. Nishikawa (KEK)
- J. Strait (Fermilab)
- M. Spiro (CERN Council)
- J. Womersley (STFC)
- T. Nakada (ECFA)
- S. Myers (CERN)
- S. Komamya (ICFA)

will be chaired by J. Ellis (CERN).

## **WG2 Optical Systems for Liquid Argon TPC Detectors**

**Author:** Benjamin Jones<sup>1</sup>

<sup>1</sup> *MIT*

**Corresponding Author:** bjpjones@mit.edu

The MicroBooNE experiment is a 170 ton scale liquid argon TPC detector which will run in the booster neutrino beam at Fermilab, starting in 2013. As well as a TPC system which will perform high resolution 3D tracking using ionization charge deposits in the argon bulk, the MicroBooNE experiment incorporates an optical system to measure scintillation light production. The optical system consists of 30 photomultiplier tubes mounted behind acrylic plates, which are coated by a wavelength shifting film. 128nm scintillation light, which is a byproduct of the ionization process, can thus be detected by the system.

There are multiple benefits to incorporating an optical system into an LArTPC detector. It can be used as an effective trigger, since the data rate and channel count is low, and noise in the PMT system is likely to be uncorrelated with noise in the TPC system. Charge drift in a TPC is slow whereas scintillation light propagation is fast, thus an accurate event time and position in the drift direction can be determined, the former being of particular importance in a pulsed beam like the Booster. And finally, the nontrivial time structure of scintillation production can, in some cases, be used to augment the particle identification capabilities of the TPC based event reconstruction methods.

I will discuss the current status of both the PMT assembly hardware and the supporting software algorithms which have been developed for MicroBooNE, and mention their relevance to future liquid argon TPC detectors.

The (International Design Report) IDR neutrino factory scenario for capture, bunching, phase-energy rotation and initial cooling of mu's produced from a proton source target is presented. It requires a drift section from the target, a bunching section and a phase-energy rotation section leading into the cooling channel. The rf frequency changes along the bunching and rotation transport in order to

form the mu's into a train of equal-energy bunches suitable for cooling and acceleration. Optimization and variations are discussed. Important concerns are rf limitations and beam losses; mitigation procedures are described. Extensions of the method for a muon collider front end and bunch combiner are discussed.

## WG2 Gamma-ray production in NC interactions

**Author:** Artur Ankowski<sup>1</sup>

<sup>1</sup> "Sapienza" Universita' di Roma

**Corresponding Author:** artur.ankowski@roma1.infn.it

In neutral current (NC) neutrino scattering off nucleus, protons and neutrons contribute almost equally to the cross section (44 and 56%, respectively). To detect the NC interactions one observes the knockout protons or the secondary interactions of neutrons. However, the gamma-rays, produced in de-excitation of residual nucleus, may provide an additional signal for detection of neutral-current events, e.g. in water Cherenkov detectors. We will describe in detail the example of the NC nucleon knockout from p3/2 shell of the oxygen nucleus, showing that this process, contributing ~42 % of the total O(nu,nu) cross section at neutrino energy 600 MeV, yields a narrow peak of gamma rays of energy 6.3 MeV with branching ratio 100%.

## The SuperBeam plus Beta Beam Combination

**Author:** Stephen Parke<sup>1</sup>

<sup>1</sup> Fermi National Accelerator Lab. (Fermilab)

**Corresponding Author:** parke@fnal.gov

WG1: The SuperBeam plus Beta Beam combination is very powerful as one needs only three of the available four appearance channels to solve for the degeneracies for Standard Model neutrinos. This allows for the extra channel to check the consistencies of the current picture and also allows for the possibilities of using the combination to search for physics beyond, such as NSI, this standard picture. All of this will be demonstrated in this talk.

62

## Neutrinoless double beta decay in seesaw models (talk@WG1)

**Author:** Jacobo Lopez-Pavon<sup>1</sup>

**Co-author:** Gersende Prior<sup>2</sup>

<sup>1</sup> IPPP, Durham University

<sup>2</sup> Universite de Geneve (CH)

**Corresponding Author:** gersende.prior@cern.ch

We study the general phenomenology of neutrinoless double beta decay in seesaw models. In particular, we focus on the dependence of the neutrinoless double beta decay rate on the mass of the extra states introduced to account for the Majorana masses of light neutrinos. For this purpose, we compute the nuclear matrix elements as functions of the mass of the mediating fermions and estimate the associated uncertainties. We then discuss what can be inferred on the seesaw model parameters in the different mass regimes and clarify how the contribution of the light neutrinos should always be taken into account when deriving bounds on the extra parameters. Conversely, the extra states can also have a significant impact, cancelling the Standard Model neutrino contribution for masses lighter than the nuclear scale and leading to vanishing neutrinoless double beta decay amplitudes even if neutrinos are Majorana particles. We also discuss how seesaw models could reconcile large rates of neutrinoless double beta decay with more stringent cosmological bounds on neutrino masses.

63

## Axial and Vector Structure Functions for Lepton-Nucleon Scattering

**Author:** Un-Ki Yang<sup>1</sup>

**Co-author:** Arie Bodek<sup>2</sup>

<sup>1</sup> *University of Manchester*

<sup>2</sup> *University of Rochester*

We present an updated model for inelastic neutrino- and electron-nucleon scattering cross sections using effective leading order parton distribution functions with a new scaling variable  $x_{1w}$ . Updated model on the axial-vector structure functions as well as vector structure functions will be presented. Our model describes all inelastic charged lepton-nucleon scattering (including resonance) data (HERA/NMC/BCDMS/SLAC/JLab) ranging from very high  $Q^2$  to very low  $Q^2$  and down to the photo-production region. The model describes existing inelastic neutrino-nucleon scattering measurements, and has been developed to be used in analysis of neutrino oscillation experiments in the few GeV region. (additional details arXiv:1011.6592 [hep-ph])

## WG2 Neutrino interaction measurements using T2K Near Detectors

**Author:** Daniel Brook-Roberge<sup>1</sup>

**Co-author:** Ilias Efthymiopoulos<sup>2</sup>

<sup>1</sup> *University of British Columbia*

<sup>2</sup> *CERN*

**Corresponding Authors:** droberge@triumf.ca, ilias.efthymiopoulos@cern.ch

The T2K near detectors provide a rich facility for measuring neutrino interactions in a high-flux environment. This talk will discuss the near detector CC-inclusive normalization analysis for the T2K oscillation result in detail, along with the present result, and describe the plan for its extension to more sophisticated measurements. Selection criteria for CCQE interactions will be

presented, as will a strategy for calculating cross-section difference between plastic scintillator and water. The unique capacities of the near detectors to measure other exclusive CC and NC channels in a narrow-band off-axis beam will also be explored.

65

## WG1 talk: NonStandard Interactions at LEP or the LHC?

**Author:** Sacha Davidson<sup>1</sup>

<sup>1</sup> *Institut de Physique Nucleaire de Lyon (IPNL)-Universite Claude*

**Corresponding Author:** s.davidson@ipnl.in2p3.fr

The New Physics which induces dimension eight Non-Standard neutrino Interactions should arise at a mass scale below a few TeV. We explore potential collider signals of such New Physics. We show that if dangerous dimension six operators vanish due to a cancellation, then double-derivative dimension eight charged lepton operators arise, and collider bounds impose  $\varepsilon_{lsim.1} \rightarrow 10^{-3}$ . Secondly, the  $v^2 \bar{\nu}_a \nu_b$  legs of an NSI operator can be related via the Equivalence Theorem to  $W^+ W^- e_{a+e_{b-}}$ , so we study the sensitivity of  $pp \rightarrow W^+ W^- e_{a+e_{b-}}$  at the LHC in a  $Z'$  model that could induce NSI.

## Study of sterile neutrino mixing in low energy neutrino factory

**Author:** Chan Fai Wong<sup>1</sup>

**Co-author:** Silvia Pascoli<sup>1</sup>

<sup>1</sup> *Durham University*

**Corresponding Author:** phydream@gmail.com

A neutrino factory has been suggested as a powerful tool for studying new physics, for example, sterile neutrinos, exploiting its near detectors.

Here we study the potential of a low energy neutrino factory (LENF) in constraining the sterile mixing angles and the mass-square difference. Unlike in conventional long baseline neutrino experiments, the electron neutrino appearance and disappearance channels are also included, since they are proved helpful in constraining sterile mixing angles.

Moreover, the recent re-analysis of reactor neutrino experiments suggests the presence of neutrino oscillations due to large sterile neutrino mixing with electron neutrino. We show that, with a near detector, LENS can constrain the sterile parameter values in a very small range and helps us to check the recent Reactor Anomaly.

Finally, we will explore the dependence of the performance of the LENS depending on different experimental setups.

WG3&WG4 Joint Session / 69

## First measurements of muon production rate using a novel pion capture system at MuSIC

**Author:** Sam Cook<sup>1</sup>

**Co-authors:** Gersende Prior<sup>2</sup>; Ilias Efthymiopoulos<sup>3</sup>

<sup>1</sup> *UCL*

<sup>2</sup> *Universite de Geneve (CH)*

<sup>3</sup> *CERN*

**Corresponding Authors:** scook@hep.ucl.ac.uk, ilias.efthymiopoulos@cern.ch, gersende.prior@cern.ch

The MuSIC (Muon Science Innovative Channel) beam line at RCNP (Research Centre for Nuclear Physics, Osaka) will be the most intense source of muons in the world. A proton beam is incident on a target and, by using a novel capture solenoid, guides the produced pions into the beam line where they subsequently decay to muons. This increased muon flux will allow more precise measurements of cLFV (charge Lepton Flavour Violation) as well as making muon beams more economically feasible. Currently the first 36<sup>circ</sup> of solenoid beam pipe have been completed and installed for testing with low proton current of 1nA. Measurements of the total particle flux and the muon life time were made. The measurements were taken using thin plastic scintillators coupled to MPPCs (Multi-Pixel Photon Counter) that surrounded a magnesium/copper stopping target. The scintillators were used to record which particles stopped and their subsequent decay times.

70

## WG1: Optimisation of the Low-Energy Neutrino Factory

**Author:** Peter Ballett<sup>1</sup>

<sup>1</sup> *IPPP, Durham University*

The Low-Energy Neutrino Factory (LENF) is a single-baseline neutrino factory operating with typical stored-muon energies less than 10 GeV. The idea behind this design is to exploit the richness of the oscillation spectrum at lower energies to achieve a strong sensitivity to the fundamental parameters whilst also mitigating the effect of degeneracies. Preliminary studies of the LENS have shown that it can meet these expectations well and can provide a competitive performance to the conventional neutrino factory of the IDS design, especially in scenarios when  $\theta_{13}$  takes relatively large values. In this talk, I will present work towards the optimisation of such a facility. In particular, we have investigated how the performance of the LENS depends upon the choice of baseline distance and stored-muon energy. The parameter ranges that we have studied connect the choices traditionally associated with the LENS to those of the higher-energy neutrino factory. Understanding this region of parameter space helps us to view the two designs as extreme ends of a spectrum of possible configurations whilst also allowing us to report revised sensitivities of such an experiment. These results are of particular importance given the recent hints of large  $\theta_{13}$  reported by T2K for which we will show that the LENS has an excellent discovery potential for CP-violation and the mass hierarchy.

71

## Minimal models with light sterile neutrinos

**Author:** Pilar Hernandez<sup>1</sup>

<sup>1</sup> *University of Valencia*

**Corresponding Author:** pilar@ific.uv.es

We study the constraints imposed by neutrino oscillation experiments on the minimal extensions of the Standard Model (SM) with  $n_R$  gauge singlet fermions ("right-handed neutrinos"), that can account for neutrino masses. We consider the most general coupling to SM fields of the new fields, in particular those that break lepton number and we do not assume any a priori hierarchy in the mass parameters. We proceed to analyze these models starting from the lowest level of complexity, defined by the number of extra fermionic degrees of freedom. The simplest choice that has enough free parameters in principle (i.e. two mass differences and two angles) to explain the confirmed solar and atmospheric oscillations corresponds to  $n_R = 1$ . This minimal choice is shown to be excluded by data. The next-to-minimal choice corresponds to  $n_R = 2$ . We perform a systematic study of the full parameter space in the limit of degenerate Majorana masses by requiring that at least two neutrino mass differences correspond to those established by solar and atmospheric oscillations. We identify several types of spectra that can fit long-baseline reactor and accelerator neutrino oscillation data, but fail in explaining solar and/or atmospheric data. The only two solutions that survive are the expected seesaw and quasi-Dirac regions, for which we set lower and upper bounds respectively on the Majorana mass scale. Solar data from neutral current measurements provide essential information to constrain the quasi-Dirac region. The possibility to accommodate the LSND/MiniBoone and reactor anomalies, and the implications for neutrinoless double-beta decay and tritium beta decay are briefly discussed.

72

## Proton Drivers for Neutrino Beams and Other High-Intensity Applications

**Author:** Roland Garoby<sup>1</sup>

<sup>1</sup> *CERN*

**Corresponding Author:** roland.garoby@cern.ch

The proton driver is an unavoidable component of any accelerator based neutrino facility. A number of laboratories in the world are using proton accelerators which could evolve for serving the future needs of neutrino physics. Possible plans will be described and preliminary schedules of realization will be sketched.

**WG3 Accelerator Physics / 73**

## **A new lattice for the beta-beam decay ring to enlarge the stability limit**

**Author:** Antoine Chance<sup>1</sup>

**Co-author:** Jacques Payet<sup>1</sup>

<sup>1</sup> CEA, IRFU, SACM

**Corresponding Author:** antoine.chance@cern.ch

The beta-beam concept relies on the production, by beta decay of radioactive ions of a very high flux, of an electron neutrino and anti-neutrino beam towards a distant detector. After production and acceleration in an accelerator complex consisting of a rapid cycling synchrotron, the CERN PS and the CERN SPS, the radioactive isotopes are injected into a long racetrack-shaped ring, called the decay ring, where they orbit until they decay or are lost. The required intensities to store in the decay ring to reach the aimed neutrino fluxes are very high. Among the collective effects, the head tail effect, caused by transversal resonance impedance, is one of the main issues: the beam was shown to be unstable with the previous decay ring lattice.

To mitigate these effects, we reduced the transition gamma by removing the injection from the arc to put it in a chicane located in one of the long straight sections. To make an amplitude detuning by inserting octupoles in the lattice could increase the stability limit. But the cost is a reduction of the dynamic aperture. After presenting the new lattice with a smaller transition gamma, we shall discuss about the needed octupoles for an amplitude detuning and their impact on the dynamic aperture.

74

## **WG4 The Final Measurement of the Muon Decay Parameters from the TWIST Experiment**

**Author:** Ryan Bayes<sup>1</sup>

**Co-author:** Gersende Prior<sup>2</sup>

<sup>1</sup> University of Glasgow

<sup>2</sup> Université de Genève (CH)

**Corresponding Authors:** r.bayes@physics.gla.ac.uk, gersende.prior@cern.ch

The TWIST (TRIUMF Weak Interaction Symmetry Test) has completed a measurement of the muon decay energy-angle spectrum with the best precision in the world [1]. This experiment consists of a simultaneous measurement of the parameters  $\rho$ ,  $\delta$ , and  $P\mu\xi$ , from highly polarized muons, to test the validity of the Standard Model (SM) in a purely leptonic interaction. The measurement of these parameters sets new limits on the fundamental coupling constants of the muon and extensions to the SM—such as left right symmetric models. The determination of the systematic uncertainties will be discussed as their control was a central concern for the experiment. The final TWIST results will be given and placed in context for physics beyond the SM.

[1] R. Bayes et al, Phys. Rev. Lett 106, 41802 (2011).

75

## WG2: MINERvA Reconstruction and Operations Status

**Author:** Gabriel Perdue<sup>1</sup>

<sup>1</sup> *The University of Rochester*

**Corresponding Author:** perdue@fnal.gov

MINERvA (Main INjectoR ExpeRiment nu-A) is a few-GeV neutrino scattering experiment that began taking data in the NuMI beam at Fermilab (FNAL) in the Fall of 2009. MINERvA employs a fine-grained detector, with an eight ton active target region composed of plastic scintillator. It also uses nuclear targets composed of carbon, iron, and lead placed upstream of the active region to measure nu-A dependence. The experiment will provide important inputs for neutrino oscillation searches and a pure weak probe of nuclear structure. We offer a set of initial kinematic distributions of interest and provide a summary of current operations and reconstruction status.

76

## POSTER Modeling neutrino-nucleus interactions in the few-GeV regime

**Authors:** Natalie Jachowicz<sup>1</sup>; Pieter Vancraeyveld<sup>1</sup>

<sup>1</sup> *Ghent University*

**Corresponding Author:** pieter.vancraeyveld@ugent.be

Detecting neutrinos and extracting the information they bring along is an ambitious task that requires a detailed understanding of neutrino-nucleus interactions over a broad energy range. Whereas the experimental observable is often an inclusive cross section, a careful study of exclusive cross sections is indispensable for a thorough understanding of these processes.

We present calculations for quasi-elastic neutrino-induced nucleon knockout reactions on atomic nuclei and neutrino-induced pion production reactions. In our models, final-state interactions are introduced using a relativistic multiple-scattering Glauber approximation (RMSGGA) approach. For interactions at low incoming neutrino energies, long-range correlations are implemented by means of a continuum random phase approximation (CRPA) approach.

As neutrinos are the only particles interacting solely by means of the weak interaction, they can reveal information about e.g. the structure of nuclei or the strange quark content of the nucleon that is difficult to obtain otherwise. We investigated these effects and present results for a.o. the sensitivity of neutrino interactions to the influence of the nucleon's strange quark sea.

77

## Measurement of CCQE cross section with T2K on-axis neutrino detector Proton Module

**Author:** Tatsuya Kikawa<sup>1</sup>

**Co-author:** Ilias Efthymiopoulos<sup>2</sup>

<sup>1</sup> *Kyoto University*

<sup>2</sup> *CERN*

**Corresponding Authors:** kikawa@scphys.kyoto-u.ac.jp, ilias.efthymiopoulos@cern.ch

The T2K (Tokai-to-Kamioka) is a long baseline neutrino oscillation experiment aiming to measure the oscillation parameters associated with muon neutrino disappearance precisely and to search for electron neutrino appearance. A high intensity neutrino beam from J-PARC (Japan Proton Accelerator Research Complex) is measured with the 280m near detector complex (ND280) and the 295km far detector (Super-Kamiokande). For the oscillation analysis of T2K, there is a large systematic error which is attributed to uncertainty of neutrino cross section. So we have constructed a new neutrino detector, "Proton Module" to measure the neutrino cross section precisely and suppress the systematic error. The Proton Module consists of 1204 plastic scintillator bars with Fiber-MPPC (Multi-Pixel Photon Counter) readout. Since it is a fully-active detector, it can reconstruct tracks of various kinds of particles from interaction point. With the tracks information, neutrino interaction mode can be identified. We will report the first result of the measurement of CCQE cross section with the Proton Module.

78

## WG1 Initial Performance from the NOvA Surface Prototype Detector

**Author:** Mathew Muether<sup>1</sup>

<sup>1</sup> *Fermilab*

**Corresponding Author:** muether@fnal.gov

NOvA, the NuMI Off-Axis  $\nu_e$  Appearance experiment will study  $\nu_\mu \rightarrow \nu_e$  oscillations, characterized by the mixing angle  $\Theta_{13}$ . Provided  $\Theta_{13}$  is large enough, NOvA will ultimately determine the ordering of the neutrino masses and measure CP violation in neutrino oscillations. A complementary pair of detectors will be constructed 14 mrad off beam axis to optimize the energy profile of the neutrinos. This system consists of a surface based 14 kTon liquid scintillator tracking volume located 810 km from the main injector source (NuMI) in Ash River, Minnesota and a smaller underground 222 Ton near detector at the Fermi National Accelerator Laboratory (FNAL). The first neutrino signals at the Ash River Site are expected prior to the 2012 accelerator shutdown. In the meantime, a near detector surface prototype has been completed and neutrinos from two sources at FNAL have been observed using the same highly segmented PVC and liquid scintillator detector system that will be deployed in the full scale experiment. Design and initial performance characteristics of this prototype system along with implications for the full NOvA program will be presented.

79

## Development of the superconducting solenoid for the MuHFS experiment at J-PARC

**Author:** Kenichi Sasaki<sup>1</sup>

**Co-authors:** Akira Yamamoto<sup>1</sup>; Koichiro Shimomura<sup>1</sup>; Michio Sugano<sup>1</sup>; Naohito Saito<sup>1</sup>; Toru Ogitsu<sup>1</sup>

<sup>1</sup> *KEK*

**Corresponding Author:** ken-ichi.sasaki@kek.jp

A new experiment to measure hyperfine transitions in the ground state of muonium, called HFS experiment, is proposed as one of the future J-PARC project.

The objective is to measure the value of the ground state hyperfine structure interval of muonium down to the level of a few ppb, and also determine the ratio of muon and proton magnetic moment with 10 ppb.

For this measurement, a magnetic field of 1.7 T with both high uniformity and stability is required.

On the other hand, the g-2 experiment at J-PARC to measure the anomalous magnetic moment of the positive muon is planned.

This experiment also requires the superconducting solenoid with high uniformity and stability, although the field strength of 3 T and the required uniform region are larger than the HFS magnet.

In order to minimize the development time and maximize the synergy between both experiments, we decided to build the magnet which could generate the field strength of 3.4 T.

This paper reports the current status of the HFS magnet system development. The field monitoring system to evaluate the field uniformity are also presented.

80

## WG1 Determination of Neutrino Mass Hierarchy with T2K and NOvA

**Author:** Suprabh Prakash<sup>1</sup>

**Co-authors:** S. UMA SANKAR<sup>1</sup>; Sushant RAUT<sup>1</sup>

<sup>1</sup> Indian Institute of Technology Bombay

We consider the ability of T2K and NOvA experiments to determine the neutrino mass hierarchy in light of the recent T2K results.

Given the relatively high lower limit  $\sin^2(2\theta_{13}) > 0.03$  set by T2K, it is worth exploring this problem. The neutrino  $\nu_{\mu} \rightarrow \nu_{e}$  oscillation probability depends on the three (until now) unknown parameters  $\theta_{13}$ ,  $\delta_{CP}$  and neutrino mass hierarchy. Now that we have a lower limit on  $\theta_{13}$ , it is possible to determine the mass hierarchy if we have some knowledge regarding  $\delta_{CP}$ .

We first consider the ability of T2K to determine  $\delta_{CP}$ . We simulate T2K data for 3 years of neutrino running plus 4 years of anti-neutrino running. Using this data, we compute the 90% C.L. allowed regions of  $\delta_{CP}$ .

We find that, for  $\delta_{CP}$  true values in the range  $\pi/4 < \delta_{CP} < 3\pi/4$ ,

the T2K allowed range is  $0 < \delta_{CP} < \pi$ .

Similarly for  $\delta_{CP}$  true values in the range

$5\pi/4 < \delta_{CP} < 7\pi/4$ ,

the T2K allowed range is  $\pi < \delta_{CP} < 2\pi$ .

Next we simulate the data for NOvA for 3 years of neutrino running plus 3 years of anti-neutrino running and compute the ability of NOvA to determine the mass hierarchy. We restrict range of true values of  $\delta_{CP}$  to be either  $\pi/4 < \delta_{CP} < 3\pi/4$  or  $5\pi/4 <$

$\delta_{CP} < 7\pi/4$ . That is we confine our attention to those values of  $\delta_{CP}$ , which T2K can determine at 90% C.L. We find that, for these ranges, NOvA can determine the neutrino mass hierarchy at 90% C.L. for  $\sin^2(2\theta_{13}) > 0.08$ .

Thus we conclude that, for half the range of  $\delta_{CP}$ , NOvA can determine the mass hierarchy at 90% C.L., if  $\sin^2(2\theta_{13}) > 0.08$ .

## WG4 J-PARC MUSE H-line optimization for the g-2 and MuHFS experiments

**Author:** Akihisa Toyoda<sup>1</sup>

<sup>1</sup> KEK

**Corresponding Author:** akihisa.toyoda@j-parc.jp

Anomalous deviation of the  $a_\mu$  factor observed by the muon g-2 experiment is significant, and should be confirmed as soon as possible.

This factor is experimentally determined by frequency difference observed by the g-2 and muon magnetic moment observed by the muonium hyperfine splitting (MuHFS).

Both two experiments are planned to be performed at the H-line of the J-PARC/MUSE which is under construction.

We optimized the beamline for each experiment with G4beamline.

For both experiments, statistics is the most important, thus beamline transmission should be maximized.

Especially for the g-2, the purpose of the present effort is to compromise between small beam size and small leakage field.

For the MuHFS, it is crucial to minimize leakage field at around final focus position, and to get all stopped muons within good field region of MuHFS magnetic field.

Detail design of the final focusing for several magnet system cases will be presented.

83

## WG4 MuHFS experiment at J-PARC

**Author:** Yasuyuki Matsuda<sup>1</sup>

**Co-author:** --- (Mu HFS collaboration)<sup>2</sup>

<sup>1</sup> Graduate School of Science-University of Tokyo

<sup>2</sup> ---

**Corresponding Author:** yasuyuki.matsuda@cern.ch

We are planning an experiment to measure hyperfine splitting frequency of the ground state of muonium atom at J-PARC MLF. Compared to the previous experiment carried out at LAMPF, the proposed experiment will benefit from the high intensity of the muon beam available at J-PARC MLF, and smaller correction due to gas pressure shift thanks to the usage of longer RF cavity, where muonium are formed and RF field are applied.

We will report the current status of the preparation for the experiment, mainly on the design of the gas chamber/RF cavity.

### WG3 Accelerator Physics / 84

## WG3 Performance Comparison Between FSIIA and Bucked Coils for the Neutrino Factory Cooling Lattice

**Author:** Androula Alekou<sup>None</sup>

**Co-authors:** Chris Rogers<sup>1</sup>; Jaroslaw Pasternak<sup>2</sup>

<sup>1</sup> STFC/RAL/ASTeC

<sup>2</sup> Imperial College London; STFC/RAL

**Corresponding Authors:** androula.alekou08@ic.ac.uk, androula.alekou@cern.ch

The transverse emittance of the muon beam produced at the Neutrino Factory front-end needs to be decreased using ionisation cooling. The current baseline cooling lattice for the Neutrino Factory, FSIIA, achieves acceptable muon transmission and transverse emittance reduction. However, recent studies indicate that high magnetic field at the position of the RF cavities may limit their maximum achievable gradient, and, since the magnetic field at the RF position of FSIIA is large, the feasibility of this lattice has come under question. A new lattice, Bucked Coils, was designed obtaining four times lower magnetic field than FSIIA while also achieving comparable transmission within 30 mm of transverse acceptance. A detailed comparison between the two lattices is presented with respect to the beam dynamics and the magnetic field.

85

## WG2 Status of the MIND Simulation and Analysis

**Author:** Ryan Bayes<sup>1</sup>

**Co-authors:** Andrew Liang<sup>2</sup>; Anselmo Cervera Villaneuva<sup>3</sup>; Paul Soler<sup>1</sup>

<sup>1</sup> University of Glasgow

<sup>2</sup> University of Tokyo

<sup>3</sup> C.S.I.C & Universidad de Valencia

A realistic simulation and analysis of a Magnetized Iron Neutrino Detector (MIND) has been developed for the purpose of understanding the potential sensitivity of such a facility. The status of the MIND simulation and reconstruction as discussed in the interim design report is reviewed here. Priorities for producing a more realistic simulation for a reference design report will be discussed, as will be the steps that have already been taken towards an improved simulation.

86

## CERN to Fréjus Super Beam, New Design (poster)

**Author:** Eric Baussan<sup>1</sup>

<sup>1</sup> *Institut Pluridisciplinaire Hubert Curien (IPHC)*

In the framework of the EUROnu design study, a new design for the CERN to Fréjus neutrino beam based on the SPL is under development by the WP2 group. This neutrino beam allows to significantly improve the measure on the mixing angle  $\sin^2(2\theta_{13})$  and CP violation by using a multi-MW proton beam of 4.5 GeV/c, a baseline of 130 km and the future water Cherenkov MEMPHYS (440 kton fiducial mass) detector as a far one. The main challenge of this project lies with the design of a multi-MW target for the proton beam. The horn and the decay tunnel parameters have been optimized with a novel procedure based on a scan of a multi-dimensional parameter space in order to maximize any potential discovery. The target design, thermo-mechanical analysis, and power supply design of the horn system as well as any safety issues are being studied to meet the MW power requirements of the proton beam. The results from the combined experiment of the Super-Beam and MEMPHYS detector and its high physics potential is also shown.

**WG3 Accelerator Physics / 87**

## **Recent developments on the muon Non-Scaling FFAG for the Neutrino Factory and its subsystems**

**Author:** Jaroslaw Pasternak<sup>1</sup>

**Co-author:** Ilias Efthymiopoulos<sup>2</sup>

<sup>1</sup> *Imperial College, London*

<sup>2</sup> *CERN*

**Corresponding Authors:** j.pasternak@imperial.ac.uk, ilias.efthymiopoulos@cern.ch

The current status and new developments on the muon Non Scaling FFAG for the Neutrino Factory studied in the framework of the EUROnu/IDS-NF projects are presented. The beam dynamics in the presence of magnet errors, misalignments including the process of acceleration is discussed. The conclusions on the magnet and alignment tolerances are drawn. The progress on the machine subsystems like main magnets and injection/extraction is discussed. The future plans for the study are given.

88

## **Alternative designs for Non-Scaling FFAGs for muon acceleration in the Neutrino Factory**

**Author:** Jaroslaw Pasternak<sup>1</sup>

<sup>1</sup> *Imperial College, London*

**Corresponding Author:** j.pasternak@imperial.ac.uk

The Non Scaling FFAG is the main candidate for the final stage of muon acceleration in the Neutrino Factory according to the IDS-NF baseline. The alternative design for the muon acceleration based on two Non-Scaling FFAGs is studied. The staging of the Non-Scaling FFAGs requires lattices with careful chromaticity correction in order to suppress the longitudinal blow up of the beam simultaneously keeping the dynamical acceptance large. The feasibility of such lattices is discussed.

**WG3&WG4 Joint Session / 89**

## Recent Studies on the PRISM FFAG Ring

**Author:** Jaroslaw Pasternak<sup>1</sup>

<sup>1</sup> *Imperial College, London*

**Corresponding Author:** j.pasternak@imperial.ac.uk

Next generation lepton flavour violation experiments require high intensity and high quality muon beams. The PRISM task force focuses on accelerator R&D for realizing such beams using an FFAG ring. The scaling and non-scaling designs for the PRISM FFAG ring are discussed. The recent studies on injection/extraction systems and matching to the solenoid channel are outlined. The future plans for the study are presented.

## WG1 Optimized Neutrino Factory for small and large $\theta_{13}$

**Author:** Sanjib Kumar Agarwalla<sup>1</sup>

**Co-authors:** Jian Tang<sup>2</sup>; Patrick Huber<sup>3</sup>; Walter Winter<sup>2</sup>

<sup>1</sup> *IFIC, CSIC-University of Valencia*

<sup>2</sup> *University of Wurzburg*

<sup>3</sup> *Department of Physics, Virginia Tech*

**Corresponding Author:** sanjib.agarwalla@ific.uv.es

In this talk, I will discuss the baseline and energy optimization of the Neutrino Factory including the latest simulation results on the magnetized iron detector (MIND). We find that in case of small  $\theta_{13}$ , baselines of about 2500 to 5000 km is the optimal choice for the CP violation measurement with  $E_\mu$  as low as 12 GeV can be considered. However, for large  $\theta_{13}$ , we show that the lower threshold and the backgrounds reconstructed at lower energies allow in fact for muon energies as low as 5 GeV at considerably shorter baselines, such as FNAL-Homestake.

This indicates that with the latest MIND simulation, low- and high-energy versions of the Neutrino Factory are just two different forms of the same experiment optimized for different parts of the parameter space.

91

## Feasibility experiment Of Granular Target Options for Future Neutrino Facilities

**Author:** Ilias Efthymiopoulos<sup>1</sup>

**Co-authors:** Chris Densham<sup>2</sup>; Leonid Rivkin<sup>3</sup>; Nikos Charitonidis<sup>4</sup>; Otto Caretta<sup>2</sup>; Peter Loveridge<sup>2</sup>; Tristan Davenne<sup>2</sup>

<sup>1</sup> *CERN*

<sup>2</sup> *RAL*

<sup>3</sup> *EPFL*

<sup>4</sup> *CERN/EPFL*

**Corresponding Author:** ilias.efthymiopoulos@cern.ch

Granular solid targets made of either fluidised tungsten powder or static pebble bed of tungsten spheres, have been long proposed and are being studied as an alternative configuration towards

high-power (>1 MW of beam power) target systems, suitable for a future Super Beam or Neutrino Factory. Such assemblies offer many advantages as better thermal and inertial stress absorption, thermal cooling and, if in the fluidised form, regeneration. The proposed feasibility experiment will try on a pulse-by-pulse basis to address the effect of the impact of a high-power pulsed beam on a target sample of tungsten powder or pebble bed. Online diagnostic tools using high-speed cameras, laser vibrometry and acoustic measurements, as well as offline, post-irradiation analysis of the target material will be used to observe the effects.

92

## Neutrino Factory Target and Capture System Optimization Studies

**Authors:** Ilias Efthymiopoulos<sup>1</sup>; Ole Hansen<sup>1</sup>

<sup>1</sup> CERN

**Corresponding Author:** ilias.efthymiopoulos@cern.ch

The target station of the neutrino factory is designed to optimize the hadron capture and produce an intense muon beam as input to the front-end. The capture section consists of a series of solenoids that produce, in the present baseline, a tapered magnetic field to focus the charged hadrons produced at the target. The effect on the focusing by changing the geometry of the solenoids and the magnetic field taper are studied in comparison to the baseline Study-2a-setup. Other optimization studies on the particle production by changing the kinetic energy of the primary proton beam to the target are reported as well.

Recent developments of high Tc coated superconductor ((RE)BCO coated conductor) lead to the possibilities of very high field magnets operated at low temperature (~4.2 K) and efficient magnets operated at high temperature (several tens of Kelvin). For accelerator applications, however, the use coated conductors has been considered difficult due to their tape shape. A project funded by Japan Science and Technology Agency is in progress to challenge the difficulties and to develop the fundamental technologies of accelerator magnets using high Tc superconductors under close collaboration between Japanese university / national laboratories and industry. The primary applications are FFAG accelerators for carbon cancer therapy and those for accelerator-driven subcritical reactor. First, the overview of the project is summarized, and, then, recent results of research and development on several key issues for applications of high Tc superconductor tapes to magnets for FFAG accelerators are presented.

This work was supported by Japan Science and Technology Agency under Strategic Promotion of Innovative Research and Development Program.
