## Correlators and SPFs

## The spectral function

## Lattice correlators

## Spectral reconstruction (Full QCD)

## Outlook

## Correlators and spectral functions

- **Heavy  $q\bar{q}$** : a thermometer of QGP in heavy ion collisions
- The **spectral functions  $\rho_H(\omega)$**  contains information about the in-medium hadron properties

$$\sum_{\vec{x}} \langle \bar{\psi} \Gamma_H \psi(\tau, \vec{x}) (\bar{\psi} \Gamma_H \psi(0, \vec{0}))^\dagger \rangle \equiv G_H(\tau) = \int_0^\infty \frac{\omega}{\pi} \rho_H(\omega) \frac{\cosh(\omega(\tau - \frac{1}{2T}))}{\sinh(\frac{\omega}{2T})}$$

## Correlators and spectral functions

- **Heavy  $q\bar{q}$** : a thermometer of QGP in heavy ion collisions
- The **spectral functions  $\rho_H(\omega)$**  contains information about the in-medium hadron properties

$$\sum_{\vec{x}} \langle \bar{\psi} \Gamma_H \psi(\tau, \vec{x}) (\bar{\psi} \Gamma_H \psi(0, \vec{0}))^\dagger \rangle \equiv G_H(\tau) = \int_0^\infty \frac{\omega}{\pi} \rho_H(\omega) \frac{\cosh(\omega(\tau - \frac{1}{2T}))}{\sinh(\frac{\omega}{2T})}$$

Strategy:

- $G_H(\tau)$  on the lattice
- Extract **spectral function**
- Estimate in-medium **hadronic properties**
- In addition transport coefficients, like **heavy quark diffusion coefficients**, are encoded in the vector meson spectral function

# The spectral function

Ref. [H. Sandmeyer's thesis]

# The spectral function

- At infinite temperature there cannot be bound states

Ref. [H. Sandmeyer's thesis]

## The spectral function

- At infinite temperature there cannot be bound states
- Melting of states visualizes in **shrinking and broadening of bound peaks**

Ref. [H. Sandmeyer's thesis]

## The spectral function

- At infinite temperature there cannot be bound states
- Melting of states visualizes in **shrinking and broadening of bound peaks**
- **Heavy quark diffusion constant** can be read off in vector channel

$$D = \frac{\pi}{3\chi_q} \lim_{\omega \rightarrow 0} \sum_{i=1}^3 \frac{\rho_V(\omega, T)}{\omega}$$

Extraction of spectral function is ill-posed problem  $\rightarrow$  large lattices needed. Ref. [H. Sandmeyer's thesis]

## SPF's contribution to correlators

$$G_H(\tau) = \int_0^{\infty} \frac{\omega}{\pi} \rho_H(\omega) \frac{\cosh(\omega(\tau - \frac{1}{2T}))}{\sinh(\frac{\omega}{2T})}$$

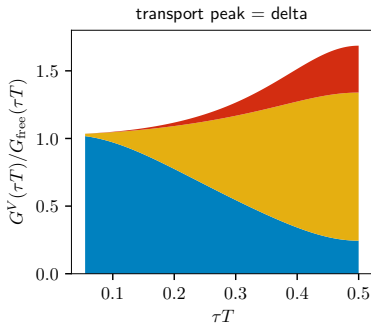

Figure: Visualization of which parts of the spectral function contribute to the correlator at different  $\tau T$ . Ref. [H. Sandmeyer's thesis]

# Spectral reconstruction (Quenched)

$$\rho_{PS}^{pert}(\omega) = \rho_{PS}^{VAC}(\omega) + A^{match} \rho_{PS}^{THERM}(\omega)$$

$$\rho_{PS}^{mod}(\omega) = A \rho_{PS}^{pert}(\omega - B)$$

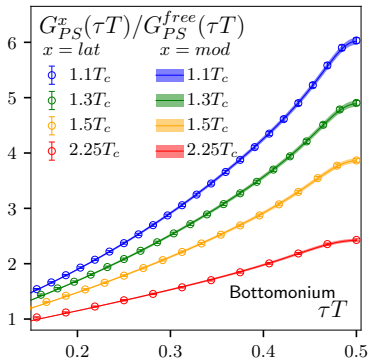

# Spectral reconstruction (Quenched)

$$\rho_{PS}^{pert}(\omega) = \rho_{PS}^{VAC}(\omega) + A^{match} \rho_{PS}^{THERM}(\omega)$$

$$\rho_{PS}^{mod}(\omega) = A \rho_{PS}^{pert}(\omega - B)$$

# Spectral reconstruction (Quenched)

Ref. [JHEP 11 (2017) 206, A. Lorenz's thesis]

# Mass tuning on mixed action (Full QCD)

- Mixed action approach (Wilson Clover fermions on HISQ configurations)
- Tadpole improved tree-level,  $c_{SW} = \frac{1}{u_0^3}$ ,  $u_0 = (tr[U_{\mu\nu}])^{\frac{1}{4}}$
- Quark mass tuning
- Tune spectrum to experimental values

## Mass tuning on mixed action (Full QCD)

- Mixed action approach (Wilson Clover fermions on HISQ configurations)
- Tadpole improved tree-level,  $c_{SW} = \frac{1}{u_0^3}$ ,  $u_0 = (tr[U_{\mu\nu}])^{\frac{1}{4}}$
- Quark mass tuning
- Tune spectrum to experimental values

- HISQ lattices from HotQCD (arXiv:2110.11659) ( $m_l = m_s/5$ );  $64^3 \times 64$ ,  $96^3 \times 32$ , new temperatures at  $96^3 \times 56$  and  $96^3 \times 28$
- Gradient flow (renormalizes the operators, removes cut-off and mixed action effects and improves signal-to-noise ratio)

# Correlators: Quenched VS Unquenched

## Perturbative SPF (Full QCD)

$$\frac{\rho_{PS}^{\text{VAC}}(\omega)}{\omega^2 m^2(\bar{\mu})} \equiv \frac{N_c}{8\pi} \tilde{R}_c^P(\omega, \bar{\mu})$$

## Perturbative SPF (Full QCD)

$$\frac{\rho_{PS}^{VAC}(\omega)}{\omega^2 m^2(\bar{\mu})} \equiv \frac{N_c}{8\pi} \tilde{R}_c^P(\omega, \bar{\mu})$$

$$\rho_V^{NRQCD}(\omega) = \frac{1}{2} \left(1 - e^{-\frac{\omega}{T}}\right) \int_{-\infty}^{\infty} dt e^{i\omega t} C_{>}$$

$$\rho_{PS}^{THERM} = \frac{M^2}{3} \rho_V^{NRQCD}, \quad \omega \approx 2M$$

## Perturbative SPF (Full QCD)

$$\frac{\rho_{PS}^{VAC}(\omega)}{\omega^2 m^2(\bar{\mu})} \equiv \frac{N_c}{8\pi} \tilde{R}_c^P(\omega, \bar{\mu})$$

$$\rho_V^{NRQCD}(\omega) = \frac{1}{2} \left(1 - e^{-\frac{\omega}{T}}\right) \int_{-\infty}^{\infty} dt e^{i\omega t} C_{\triangleright}$$

$$\rho_{PS}^{THERM} = \frac{M^2}{3} \rho_V^{NRQCD}, \quad \omega \approx 2M$$

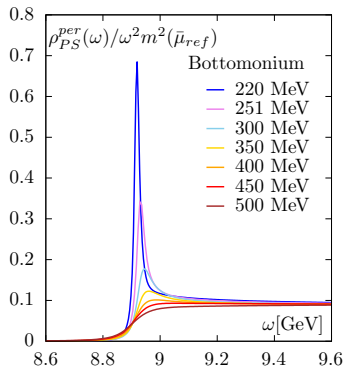

$$\rho_{PS}^{pert}(\omega) = \rho_{PS}^{VAC}(\omega) + A^{match} \rho_{PS}^{THERM}(\omega)$$

Ref. [JHEP 11 (2017) 206]

# Perturbative SPF (Full QCD)

# Perturbative SPF (Full QCD)

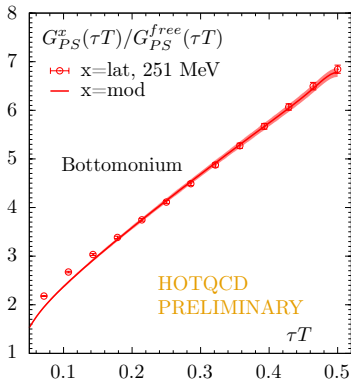

# Spectral reconstruction (Full QCD)

$$\rho_{PS}^{mod}(\omega) = A \rho_{PS}^{pert}(\omega - B)$$

# Spectral reconstruction (Full QCD)

$$\rho_{PS}^{mod}(\omega) = A \rho_{PS}^{pert}(\omega - B)$$

## Outlook

- Extend the studies on spectral and transport properties from quenched to dynamical QCD
- Study light quark mass effects by comparing  $m_l = m_s/5$  and  $m_l = m_s/27$
- Study cut-off effects and perform continuum extrapolation
- Improve on perturbative and non-perturbative spectral function models
- Spectral reconstruction based on spectral function model fits and other reconstruction methods
- Estimate in-medium hadronic and transport properties (Kubo relation)

**Thank you for your attention !**
