Technical Galleries Consolidation- Follow up of actions

TG-CONS Project board meeting #2

Adrianos Filinis, on behalf of the TG-CONS core team

Actions defined at the last PB#1

Action no. Description

1. Contact SCE regarding the Integrated Safety documents update.
2. Define the detailed scope of the TG-CONS Project.
3. Consider rearrangement of SCE and CV piping works. **Sebastien will address on Schedule slides**
4. Distribute specific guidelines to clarify the ECR process
5. Prepare M2P request for MTP exercise. **Sebastien will address on budget slides**
6. Check the official French/Swiss regulations on how often specific systems must be replaced.
7. Contact SCE, CV and other relevant services (e.g.: HSE) regarding Desired temperature range of heating system. **Sebastien will address**
8. Create a global budget request regarding maintenance and operation after the completion of galleries' renovation.

Action no. 1 and 2

1) Contact SCE regarding the Integrated Safety documents update:

- Still early to be able to close this action
- There is a clear distinction between tertiary and machine galleries since 2011, [EDMS : 1176596](#)
- There are new discussions to define the ownership of the galleries (in our case) and the distinction between machine and tertiary at the meeting: **Boundaries Responsibilities EN/SCE**
- In the TG-CONS project we follow the guidelines from GIS until new guidelines are published, an excel file have been prepared with all Tertiary and machine galleries, existing TSO

2) Define the detailed scope of the TG-CONS Project:

- It is clear that TG-CONS will not replace all existing equipment but rather the critical ones, that can't last for the next 30 years.
- An example of such system, is the Cryogenic equipment. It is in good condition and there are discussions to find optimal solution between displacing and replacing them

Action no. 4 ECR, When Handling Changes

- 1st step: need for a change identified
- Projects responsible for the required change

- In Technical Galleries: using Engineering Change Requests (ECRs)
 - Determine an associated name for the change (equipment, function, layout, service...)
- What for:
 - Inform other stakeholders and get their approval/refusal
 - Impact analysis (cost, schedule, performance)
 - Allow all persons concerned the opportunity to comment about the impact of changes on surrounding equipment or general planning
-  Use TG CONS version of ECR with approval procedure and checkers list, [EDMS:2664831](https://cds.cern.ch/record/2664831)

Action no. 6: Check the official French/Swiss regulations on how often specific systems must be replaced

2. CERN regulations according to the Swiss and French authorities on inspection and maintenance of equipment in the TG.

Table 1 - How often specific equipment found in the technical galleries should be checked and changed

Equipment	Maintenance Regulations
Level 3 Alarms	The group technically in charge must ensure that the alarm systems are regularly maintained and, at least once a year, checked and calibrated in accordance with procedures to be established with the TIS Division. Each test must be documented by the group technically in charge to ensure the traceability of maintenance work [1]
AUG	The competent electrical service at CERN must make arrangements for their regular maintenance and must carry out operational inspections of the alarm systems at least once a year, in line with procedures to be drawn up with TIS Division (IS 37). These inspections will be the subject of a summary report, a copy of which must be sent to the TIS DS Group. Work on the AUGs must be traceable. The AUGs must come under the responsibility of a single service with an adequate knowledge of the electrical power distribution network [2]
Electrical Equipment	Safety regulations must be taken into account right from the initial conception stage of electrical equipment and installations. In particular, the design of electrical installations must comply with CERN regulations concerning emergency stops (Ref. IS 3). Moreover, electrical equipment and installations must be inspected before they are first used, after any major modifications and subsequently at suitable intervals - before putting into service. Inspections must be carried out by those responsible for the construction and operation of the equipment. They must be recorded. Users are responsible for carrying out and recording regular inspections [3]
Lighting/Emergency lighting	1) Maintenance mensuelle - Mise en service des éclairages de sécurité en simulant la défaillance des alimentations normales, sans tester l'autonomie de l'installation ; - Essais des dispositifs de mise à l'état de repos ; 2) Maintenance semestrielle Test d'autonomie d'au moins 1 heure, sans dégrader la disponibilité des installations de sécurité dans les périodes d'exploitation des ouvrages ; 3) Registre ou carnet de maintenance Chaque opération de maintenance devra être tracée dans le registre de l'éclairage (rapport EDMS par ex) ; 4) Inspection initiale - Examen du dossier technique de l'installation ; - Examen sur site des conditions d'installation ; - Mise en service des éclairages de sécurité en simulant la défaillance des alimentations normales, sans tester l'autonomie de l'installation ; - Essais des dispositifs de mise à l'état de repos ; - Contrôle visuel d'état et du positionnement des luminaires ; 5) Inspection périodique annuelle Mise en service des éclairages de sécurité en simulant la défaillance des alimentations normales, sans tester l'autonomie de l'installation ; Essais des dispositifs de mise à l'état de repos ; Contrôle visuel d'état et du positionnement des luminaires. [4]
Mechanical Equipment	Periodic inspections. The owning organic unit shall ensure that, where required, the item of mechanical equipment is subject to the periodic inspections defined in the applicable CERN Safety Rules or, where none exist, in the form of the Hot Stop in which the item of mechanical equipment is used. Maintenance. The organic unit owning an item of mechanical equipment shall ensure that it is correctly maintained to guarantee its safe use and the safety of its users. Maintenance shall be based, in particular, on the manufacturer's instructions, where they exist. [5]

Equipment	Periodic Inspections																																						
Standard Pressure Equipment	Standard pressure equipment (excluding standard pressure equipment with a maximum allowable pressure of PS ≤ 0.5 bar), as well as all safety accessories, shall be subject to periodic inspections comprising: <ul style="list-style-type: none"> • a check of the Safety File; • a general check of the installation conditions (if applicable); • a visual check; • a check that the item of equipment is in an identical state to that defined by the manufacturer for all reasonably foreseeable conditions; • functional checks to make sure that the item of standard pressure equipment can perform its specific functions safely, with no risk to personnel or the surrounding environment. These periodic inspections shall also include the additional Safety requirements of the Specific Safety Instructions, where they exist. A check of the correct operation of safety accessories, where they exist, is compulsory for all standard pressure equipment. Except in the case of a hired item of standard pressure equipment, the periodic inspections shall be performed by the CERN Safety Inspection Service, at the request of the owning organic unit. The user entity using an item of standard pressure equipment, including hired equipment, shall be responsible for making sure that it has undergone a periodic inspection. Any item of standard pressure equipment which fails a periodic inspection and cannot be repaired shall be decommissioned and dismantled without delay (cf. Section 2.10). Periodic inspections shall be documented and the corresponding data archived in the Safety File. Maintenance. The organic unit owning the item of standard pressure equipment shall establish a maintenance schedule which guarantees the safety of users and operational safety, based on the manufacturer's instructions or on the additional Safety requirements of the Specific Safety Instructions where they exist. Maintenance operations shall be carried out, inspected and included in the Safety File. Where such standard pressure equipment has been hired, maintenance shall be the responsibility of the owner. The user entity using the item of standard pressure equipment shall be responsible for making sure that the maintenance operations have been performed [5] 																																						
Cryogenic Equipment	Periodic inspections. All items of pressurized cryogenic equipment, as well as safety accessories, shall be periodically inspected and qualified as follows: <table border="1"> <thead> <tr> <th rowspan="2">Safety accessories</th> <th colspan="2">Periodic inspections</th> <th rowspan="2">Frequency</th> <th rowspan="2">Performed by</th> </tr> <tr> <th>Type of test</th> <th>Interval</th> </tr> </thead> <tbody> <tr> <td rowspan="2">Safety valves for inert fluids, including oxidizing fluid</td> <td rowspan="2">Functional test: Test bench verification of: • set pressure • leak tightness</td> <td>5 years</td> <td rowspan="2">The DS Unit at the request of the owning organic unit.</td> </tr> <tr> <td>3 years</td> </tr> <tr> <td>Repair discs</td> <td colspan="2">No periodic inspection required, but rupture discs must be replaced at intervals defined by the manufacturer or when it shows signs of damage, and after 20 years at the latest.</td> <td>The owning organic unit.</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th rowspan="2">Pressurized cryogenic equipment</th> <th colspan="2">Periodic inspections</th> <th colspan="2">Inspection</th> </tr> <tr> <th>Type of inspection</th> <th>At intervals of</th> <th>Type of test</th> <th>At intervals of</th> </tr> </thead> <tbody> <tr> <td rowspan="2">Fixed</td> <td rowspan="2">External visual inspection, including safety accessories</td> <td rowspan="2">5 years</td> <td rowspan="2">The DS Unit at the request of the owning organic unit.</td> <td>Not applicable</td> </tr> <tr> <td>Pressure and leak tightness test at 0.8 times of the maximum allowable pressure (PS)</td> <td>5 years</td> </tr> <tr> <td rowspan="2">Transportable</td> <td rowspan="2">External visual inspection, including safety accessories</td> <td rowspan="2">3 years</td> <td rowspan="2">Not applicable</td> <td>Not applicable</td> </tr> <tr> <td>Not applicable</td> </tr> </tbody> </table>	Safety accessories	Periodic inspections		Frequency	Performed by	Type of test	Interval	Safety valves for inert fluids, including oxidizing fluid	Functional test: Test bench verification of: • set pressure • leak tightness	5 years	The DS Unit at the request of the owning organic unit.	3 years	Repair discs	No periodic inspection required, but rupture discs must be replaced at intervals defined by the manufacturer or when it shows signs of damage, and after 20 years at the latest. Safety accessories	Periodic inspections		Frequency	Performed by																																			
	Type of test	Interval																																					
Safety valves for inert fluids, including oxidizing fluid	Functional test: Test bench verification of: • set pressure • leak tightness	5 years	The DS Unit at the request of the owning organic unit.																																				
		3 years																																					
Repair discs	No periodic inspection required, but rupture discs must be replaced at intervals defined by the manufacturer or when it shows signs of damage, and after 20 years at the latest.		The owning organic unit.																																				
Pressurized cryogenic equipment	Periodic inspections		Inspection																																				
	Type of inspection	At intervals of	Type of test	At intervals of																																			
Fixed	External visual inspection, including safety accessories	5 years	The DS Unit at the request of the owning organic unit.	Not applicable																																			
				Pressure and leak tightness test at 0.8 times of the maximum allowable pressure (PS)	5 years																																		
Transportable	External visual inspection, including safety accessories	3 years	Not applicable	Not applicable																																			
				Not applicable																																			

The visual inspection consists of a general check of the installation conditions and a check that the item of pressurized cryogenic equipment is in an identical state to that defined by the manufacturer for all reasonably foreseeable conditions. This

Action no. 8: global budget request

- **A very important action for the project, that it is not possible to address 100% at this stage**
- **As many inventories are on going, it is not easy to know the impact of the consolidation and maintenance work**
- **For every modification and intervention an impact is created for the different stakeholders to be informed**
