## High temperature annealing of irradiated LGADs

*Thursday 23 June 2022 11:10 (20 minutes)*

LGADs irradiated up to  $6 \times 10^{15}$  n/cm<sup>2</sup> with reactor neutrons were annealed at high temperatures between 300C and 450C. Annealing was for 30 minutes in steps of 50C. CV measurements were made after each annealing step and a significant increase of gain layer depletion voltage was observed. Charge collection and timing resolution were measured with electrons from Sr-90 showing beneficial effect of short term high temperature annealing of irradiated LGADs.

**Primary authors:** HOWARD, Alissa Shirley-Ann (Jozef Stefan Institute (SI)); HITI, Bojan (C); KRAMBERGER, Gregor (Jozef Stefan Institute (SI)); MANDIC, Igor (Jozef Stefan Institute (SI)); NOVAK, Brigita (Jožef Stefan Institute); MIKUŽ, Marko (Jozef Stefan Institute (SI)); CINDRO, Vladimir (Jozef Stefan Institute (SI)); KLJUN, Žan (Jožef Stefan Institute)

**Presenter:** KRAMBERGER, Gregor (Jozef Stefan Institute (SI))

**Session Classification:** Low Gain Avalanche Detectors
