

Legend, Assumptions:

- l : e/μ
- L : $e/\mu/\tau$
- j_l : light jet
- b : bottom jet
- t : top jet
- j_3 : b/t
- J : j_l/j_3
- SU(2) doublet sparticles are (nearly) mass degenerate.
- Whenever two signals are equally likely, we only write the one with more leptons.
- Whenever two signals with the same number of leptons are equally likely, we only write the one with more leptons from the first two generations.
- Sometimes we state more than one signature for a given transition because one signature might be preferable in the above sense (it has more leptons) but the other one might be more probable (for instance it has a higher cross-section, or may be the only kinematically accessible one, etc.).
- We take into account the possibility that the sleptons, electroweakinos and third generation squarks might be light enough that their decay into a top quark might be kinematically disfavoured. But we do not do this for the gluino/first two generation squarks.
- The tables contain the **minimal set** of objects that should always appear in pair production of the LSP followed by its decay. There can always be more objects.
