

AR2D2 DETECTOR SIMULATION

MEGAN FOSTER

Dark matter –
85% of the
universe

Indirect
detection

Direct
detection

SCINTILLATING DETECTORS

Backgrounds

- Atmospheric/external radiation
- Radiation from detector materials
 - Ar39

THE AR2D2 DETECTOR

DESIGN

Backgrounds

- ~~Atmospheric/external radiation~~
- Radiation from detector materials
 - Ar39

MATERIALS

- Activity of each layer taken from SNOLAB gamma assays website
- Relative abundancies taken from SNOLAB branching percentages website
- Simulation used to determine usable geometry and materials

Backgrounds

- ~~Atmospheric/external radiation~~
- ~~Radiation from detector materials~~
- Ar39

THE SIMULATION

PREVIOUS WORK

Separate simulations for each layer of the detector, SiPMs, and external

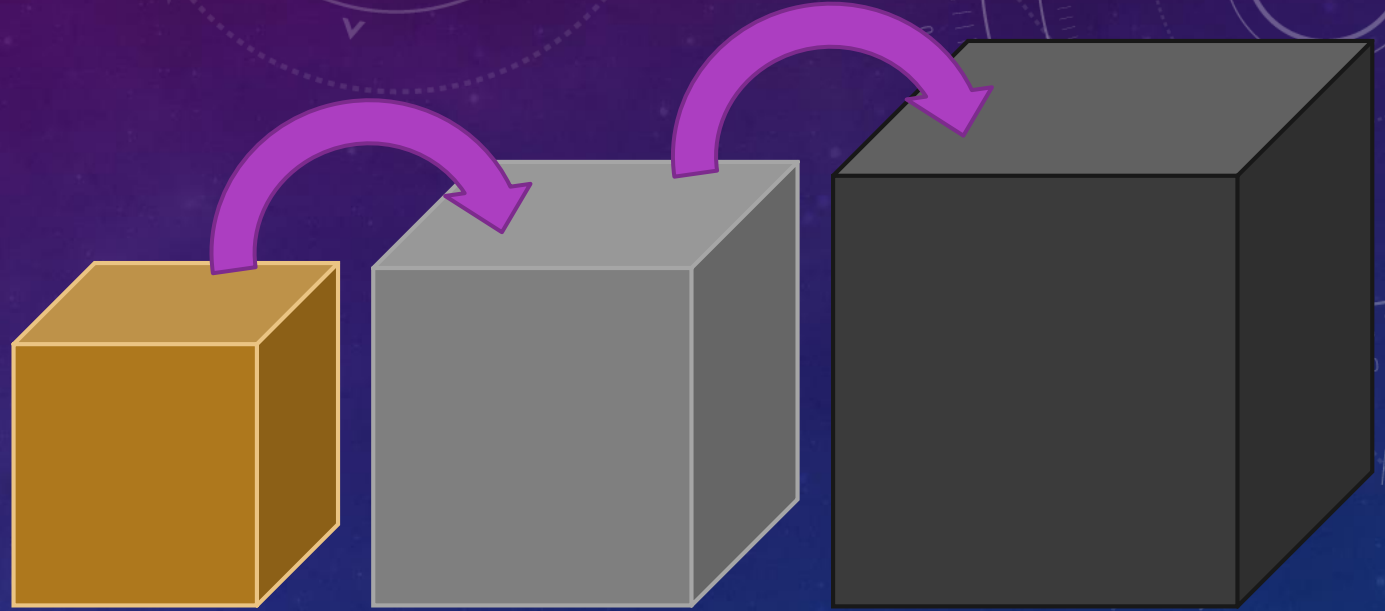

Detector partially defined in geometry file

Visualizations complete

Actual geometry

Simulated geometry (nested solid volumes)

STEP 1 - GEOMETRY

CREATE A .GEO FILE CONTAINING ALL COMPONENTS OF THE DETECTOR

STEP 2 – GENERATE MACROS

Calculate event counts (N) for each element in decay chain

Specify energy of decay

Specify location of origin (fillshell)

Specify how many times to run simulation (N)

```
/generator/add combo gun:fillshell  
/generator/vtx/set gamma 0 0 0 0.29521  
/generator/pos/set 294.0 0.0 0.0 0.0 0.0 0.0 50.0 5000.0  
/run/beamOn 75232
```

N

STEP 3 – RUN SIMULATION

- Submit to nearline
- Results are stored in .root files
- Position information is stored in RAT logs and ROOT Tree

```

```

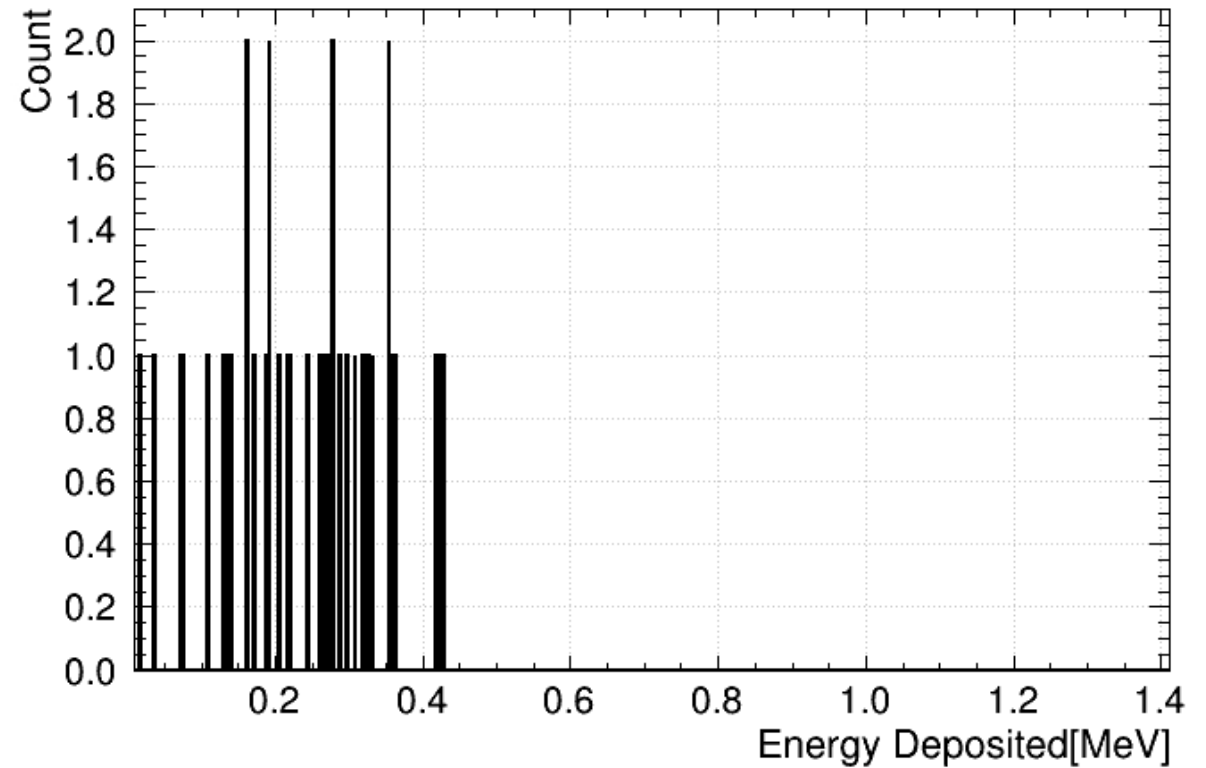

RESULTS

FULL DETECTOR SIMULATION (EXCLUDING LEAD LAYER)

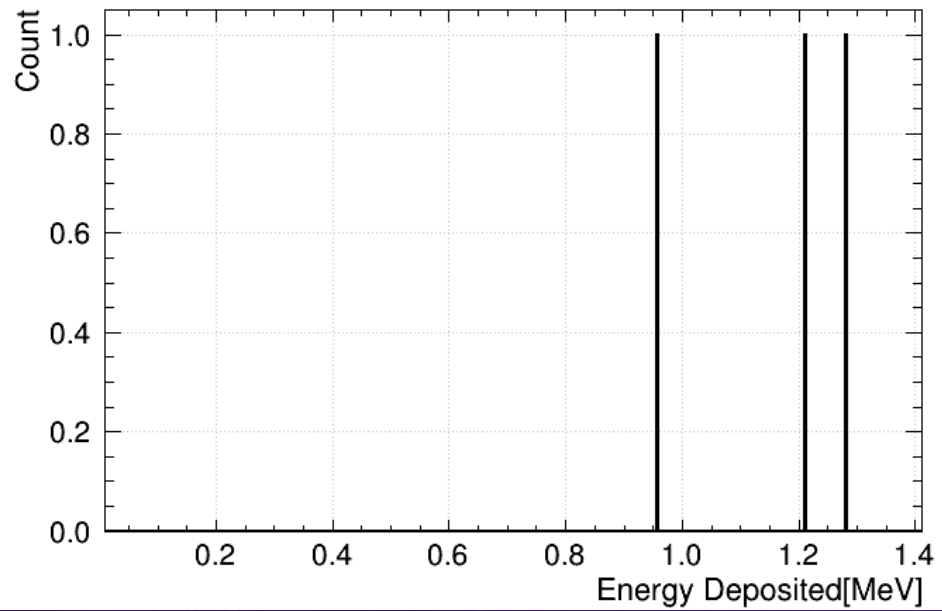

Energy deposition in LAr by full detector (**excluding lead layer**)

Energy deposition in LAr by Ar39

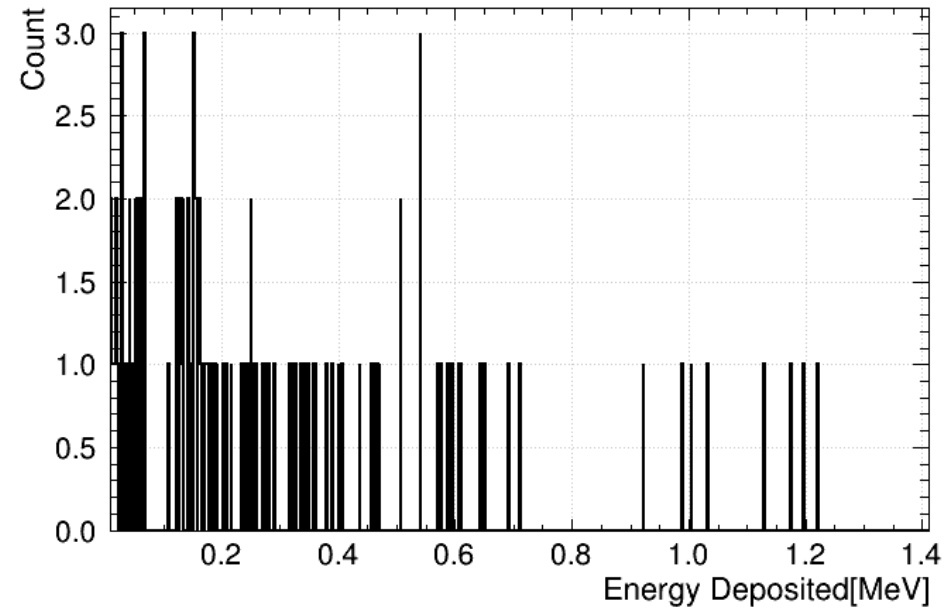

Energy deposition in LAr by incopper

Energy deposition in LAr by copper

Energy deposition in LAr by lblead

CONCLUSIONS & FUTURE WORK

- Layer that contributes most to background in range of interest: clean lead
- Future work:
 - Run entire simulation with SiPMs and external backgrounds
 - Edit detector composition and geometry to mitigate backgrounds from clean lead

THANK YOU!
