New sources of CPV

Must be **proportional to invariants. Which ones?**

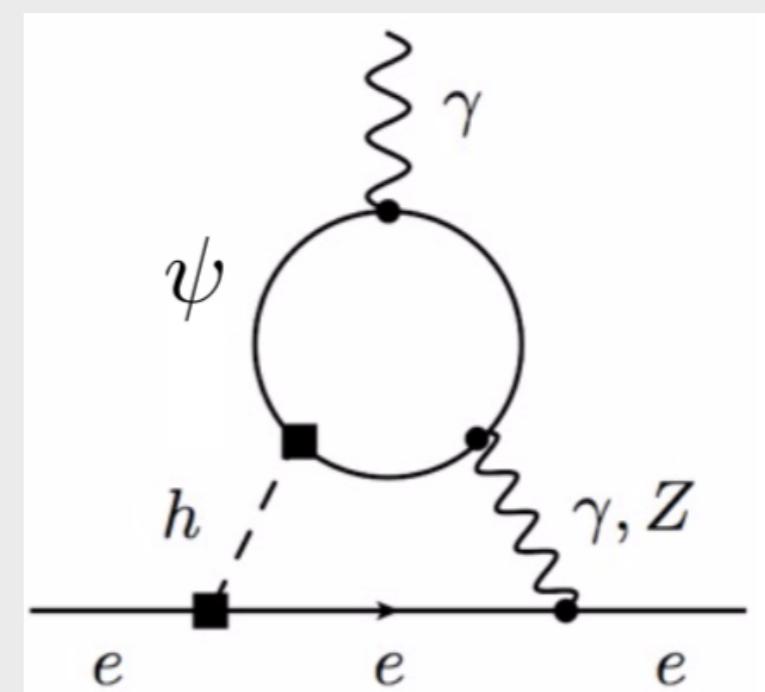

SM CPV could interfere with SMEFT coefficients. Ex : loops over three generations, electroweak and SMEFT vertices.

⇒ « Simple » graphs map to new sources of CPV (for invariant observables, e.g. EDMs)

Example : Barr-Zee two-loop contribution to the electron EDM

$$\mathcal{L} = \mathcal{L}_{SM} + \frac{C_{uH}}{\Lambda^2} |H|^2 \overline{Q_L} u_R \tilde{H} + h.c.$$

$$\frac{d_e}{e} = -\frac{1}{48\pi^2} \frac{v m_e m_u}{m_h^2} \text{Im}(C_{uH}) F_1 \left(\frac{m_u^2}{m_h^2}, 0 \right)$$
