

The n2EDM experiment at PSI

↓
neutron Electric Dipole Moment

FPCP 2023

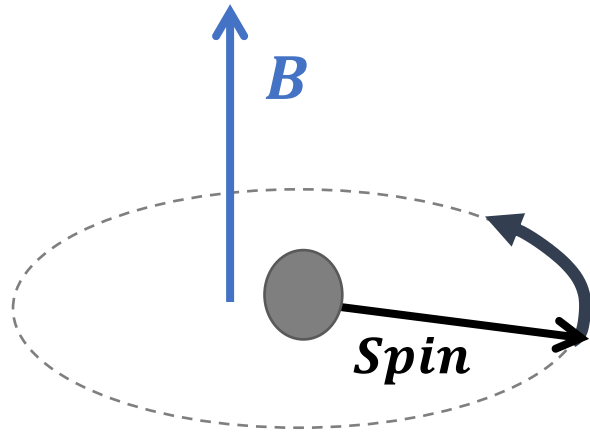

Thomas Bouillaud – LPSC Grenoble.

17/03/2022

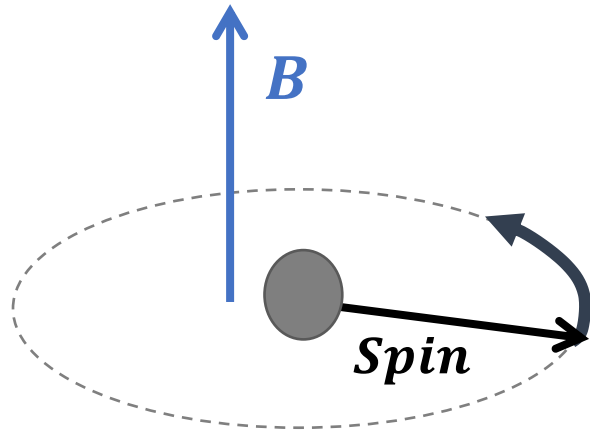

What is the electric dipole moment?

Motion of a spin $\frac{1}{2}$ particle in a [magnetic field](#):

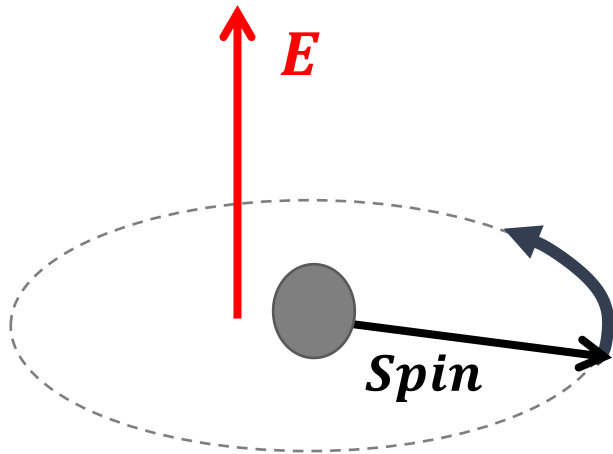

- $H = -\mu \boldsymbol{\sigma} \cdot \mathbf{B}$
- If $\mathbf{B} = B_0 \mathbf{u}_z$, precession motion with frequency given by $\hbar 2\pi f = 2\mu B_0$
- Neutron in $B_0 = 1 \mu\text{T} \rightarrow f \approx 30 \text{ s}^{-1}$

What is the electric dipole moment?

Motion of a spin $\frac{1}{2}$ particle in a [magnetic field](#):

- $H = -\mu \sigma \cdot B$
- If $B = B_0 u_z$, precession motion with frequency given by $\hbar 2\pi f = 2\mu B_0$
- Neutron in $B_0 = 1 \mu\text{T} \rightarrow f \approx 30 \text{ s}^{-1}$

What about a spin $\frac{1}{2}$ particle in an [electric field](#)?

- $H = -d \sigma \cdot E$
- If $E = E_0 u_z$, precession motion with frequency given by $\hbar 2\pi f = 2d E_0$
- Neutron in $E = 15 \text{ kV/cm} \rightarrow f < 2 \text{ year}^{-1}$

With current limit $d_n < 10^{-26} e \cdot \text{cm}$

Why measure the neutron EDM?

Cosmological motivation: explain baryon asymmetry $\eta = \frac{n_B - n_{\bar{B}}}{n_\gamma} \approx 10^{-10}$

Sakharov conditions for baryogenesis:

1. Non-conservation of baryonic number
2. Out-of-equilibrium thermal interactions
3. **Violation of C and CP symmetries**

Why measure the neutron EDM?

Cosmological motivation: explain baryon asymmetry $\eta = \frac{n_B - n_{\bar{B}}}{n_\gamma} \approx 10^{-10}$

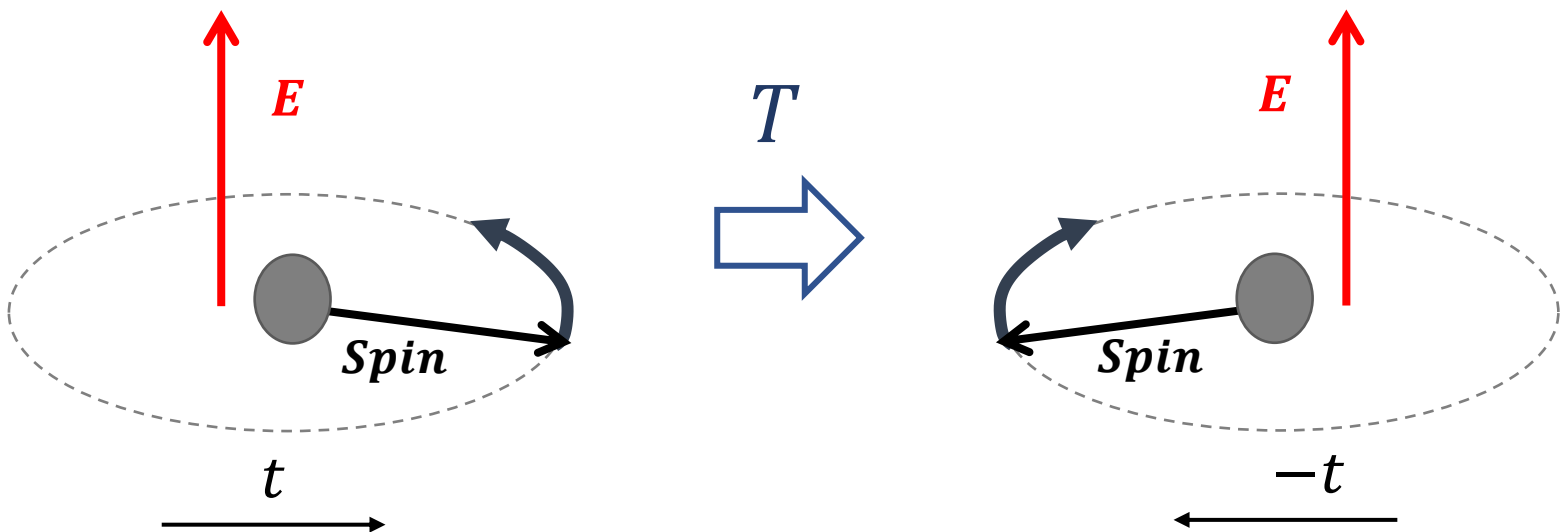

Sakharov conditions for baryogenesis:

- 1. Non-conservation of baryonic number
- 2. Out-of-equilibrium thermal interactions
- 3. **Violation of C and CP symmetries**

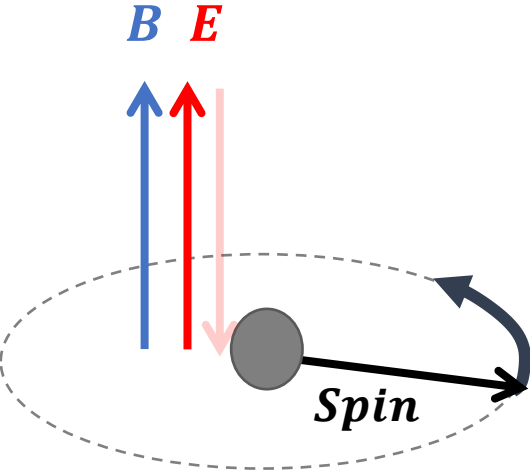

$CP: i d \bar{f} \sigma_{\mu\nu} \gamma_5 f F^{\mu\nu} \rightarrow -i d \bar{f} \sigma_{\mu\nu} \gamma_5 f F^{\mu\nu}$

$T: -d \boldsymbol{\sigma} \cdot \mathbf{E} \rightarrow +d \boldsymbol{\sigma} \cdot \mathbf{E}$

EDMs are described by couplings that violate CP
(or T by CPT)

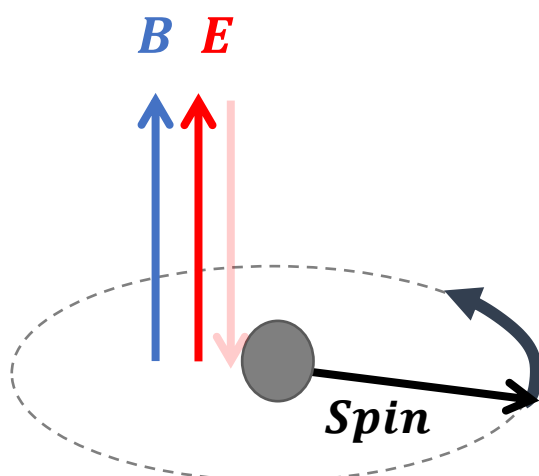

How do we measure the neutron EDM?

$$2\pi f_n = \frac{2\mu_n}{\hbar} B_0 \pm \frac{2d_n}{\hbar} E_0 \quad \Rightarrow \quad f_n(\uparrow\uparrow) - f_n(\uparrow\downarrow) = -\frac{2}{\pi\hbar} d_n E_0$$

How do we measure the neutron EDM?

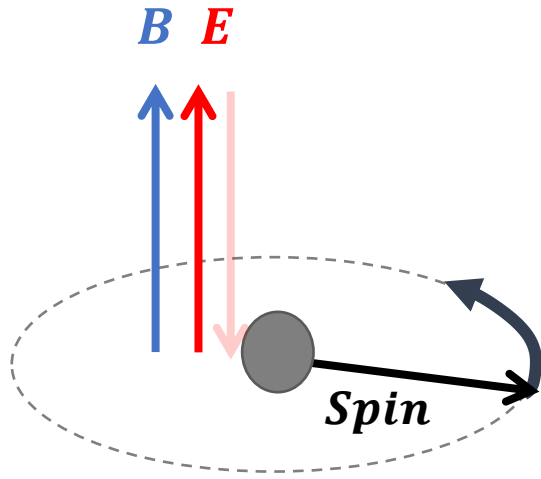

$$2\pi f_n = \frac{2\mu_n}{\hbar} B_0 \pm \frac{2d_n}{\hbar} E_0 \quad \Rightarrow \quad f_n(\uparrow\uparrow) - f_n(\uparrow\downarrow) = -\frac{2}{\pi\hbar} d_n E_0$$

$f_{n,\text{larmor}} \approx 30 \text{ s}^{-1}$
at $B_0 = 1\mu\text{T}$

If $d_n = 10^{-26} \text{ e} \cdot \text{cm}$:

$f_{n,\text{elec}} \approx 2 \text{ year}^{-1}$
at $E_0 = 15 \text{ kV} \cdot \text{cm}^{-1}$

How do we measure the neutron EDM?

$$2\pi f_n = \frac{2\mu_n}{\hbar} B_0 \pm \frac{2d_n}{\hbar} E_0 \Rightarrow f_n(\uparrow\uparrow) - f_n(\uparrow\downarrow) = -\frac{2}{\pi\hbar} d_n E_0$$

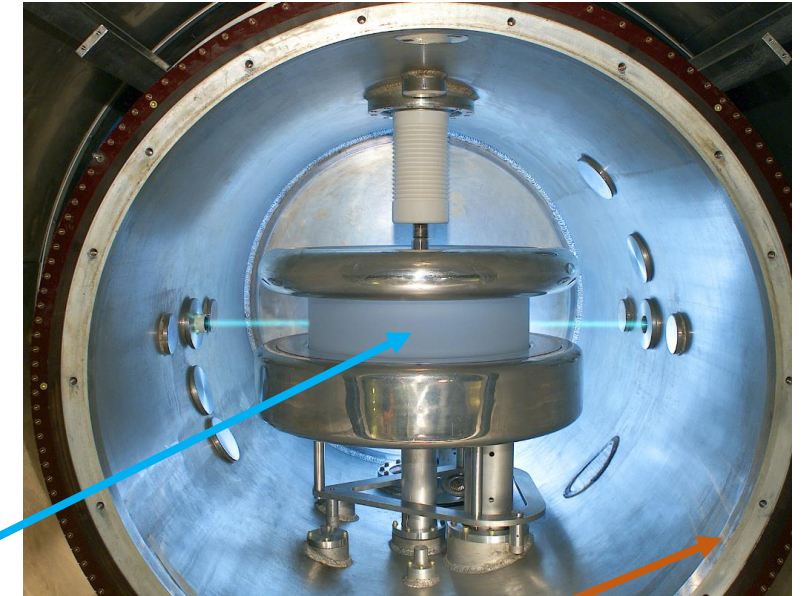

$$f_{n,\text{larmor}} \approx 30 \text{ s}^{-1} \text{ at } B_0 = 1 \mu\text{T}$$

If $d_n = 10^{-26} \text{ e} \cdot \text{cm}$:

$$f_{n,\text{elec}} \approx 2 \text{ year}^{-1}$$

at $E_0 = 15 \text{ kV} \cdot \text{cm}^{-1}$

Previous experiment: nEDM @ILL

What can we do to detect something that small?

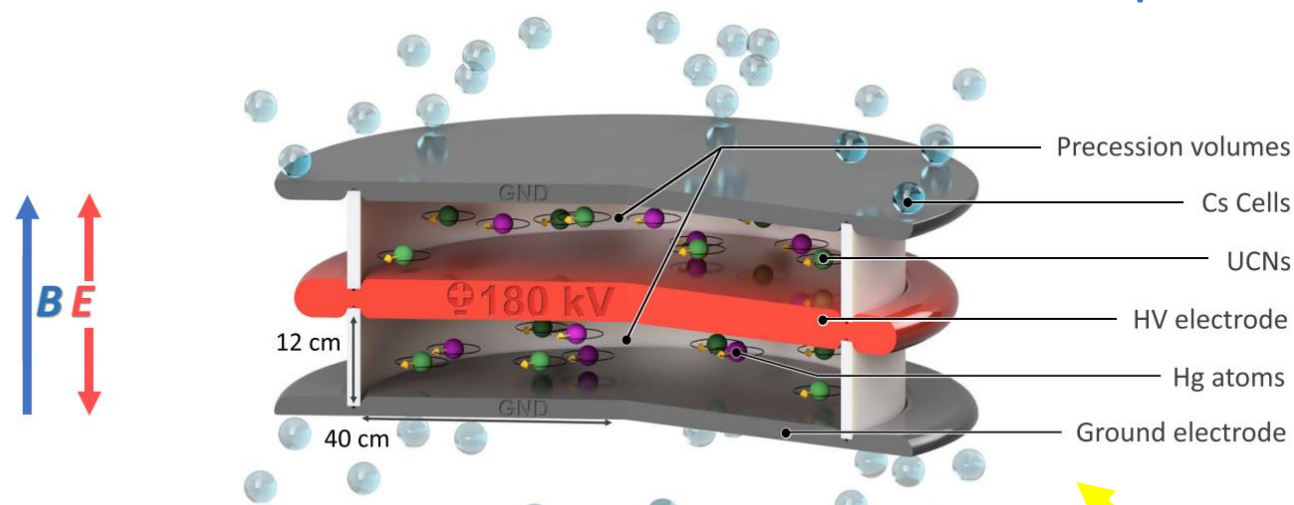

- Maximize the interaction time
- Maximize the statistics
- Control the magnetic field

→ Ultra Cold Neutrons (UCNs).

→ Large cell volume, efficient UCN transport.

→ Co-magnetometry, magnetic shielding.

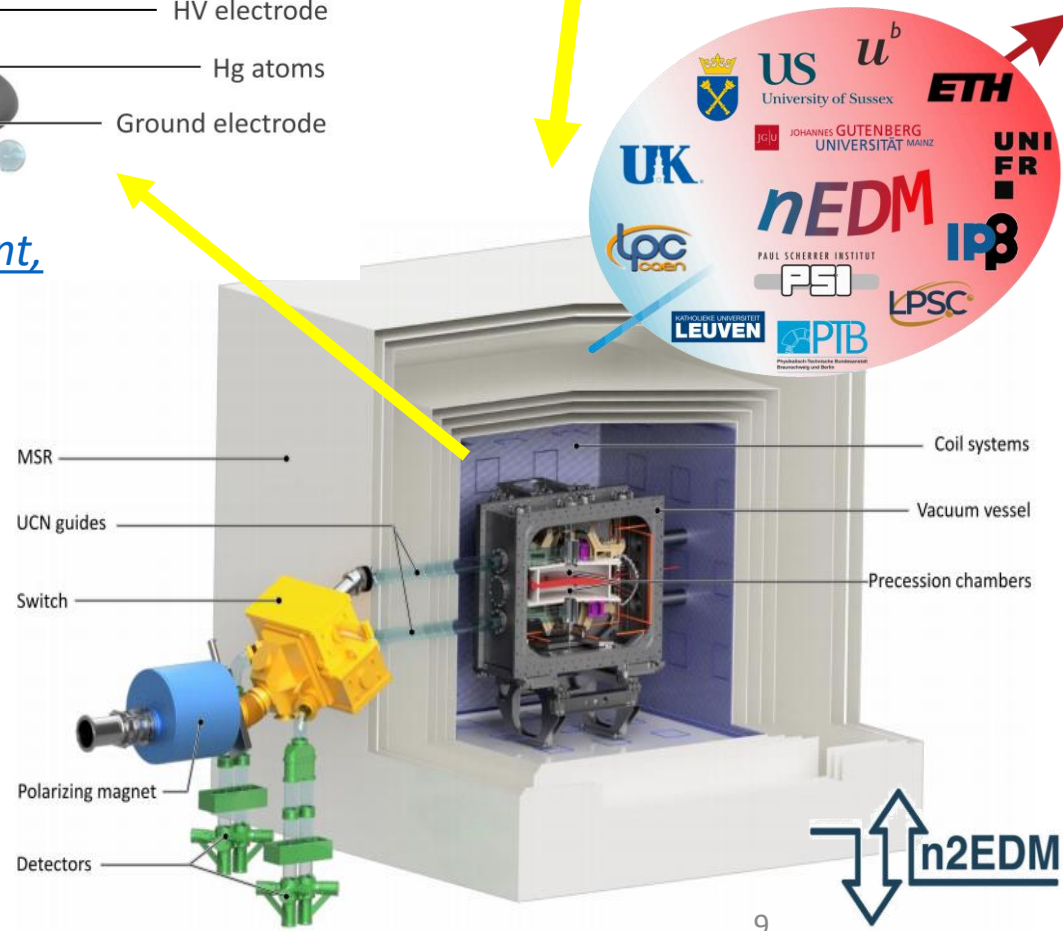

The n2EDM concept

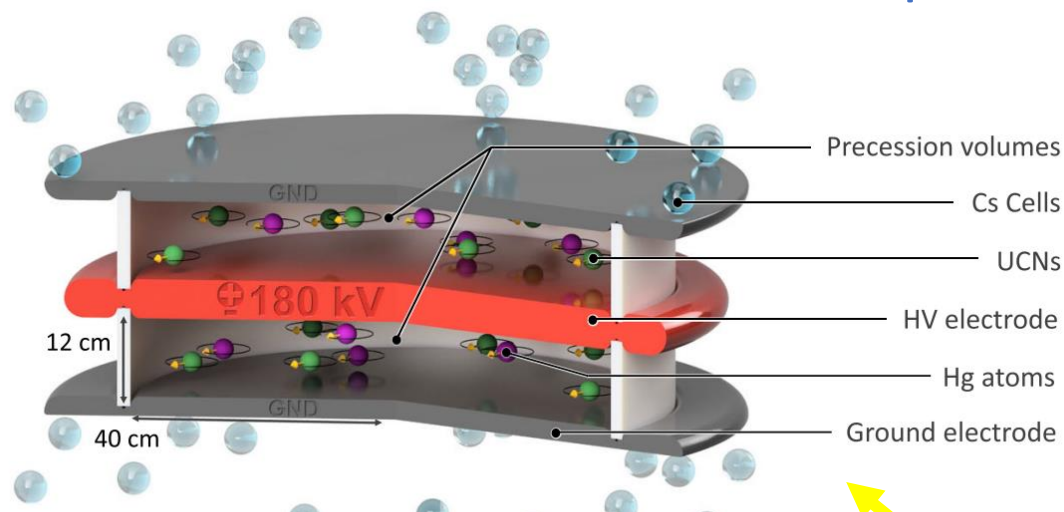

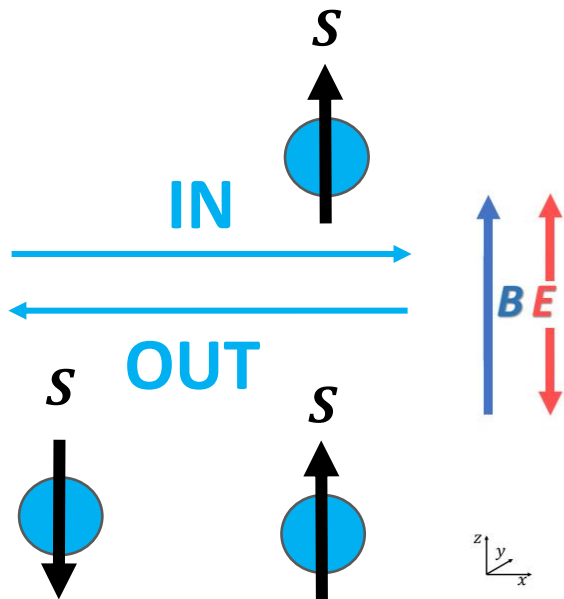

The design of the n2EDM experiment, Ayres et al, EPJC (2021).

PSI, Switzerland.

The n2EDM concept

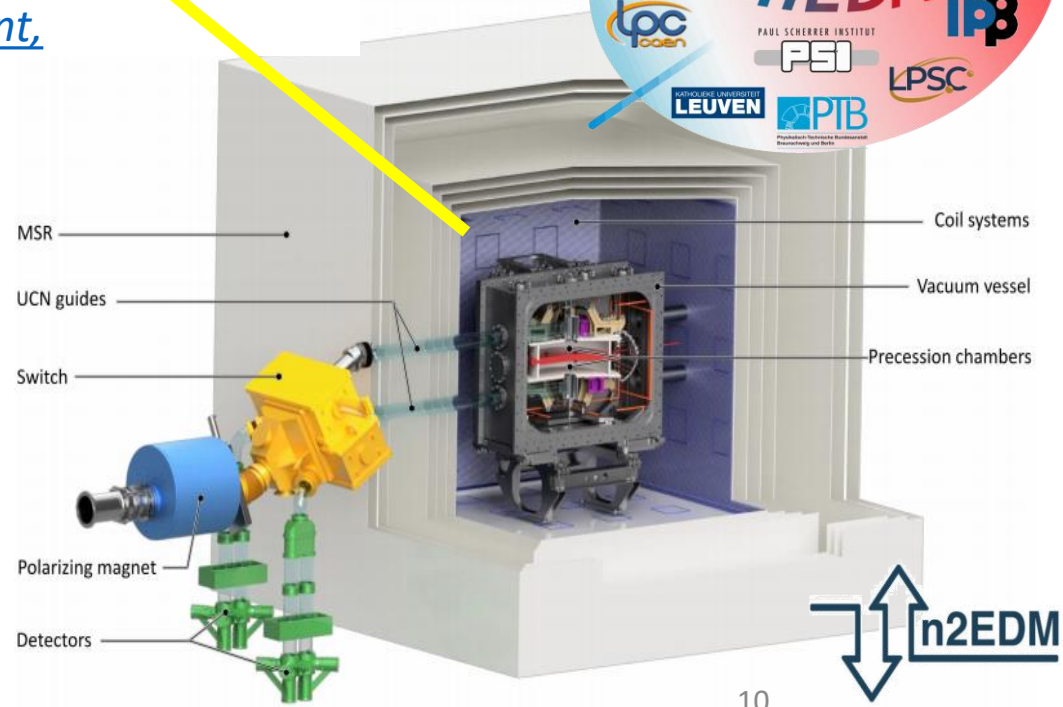

The design of the n2EDM experiment, Ayres et al, EPJC (2021).

PSI, Switzerland.

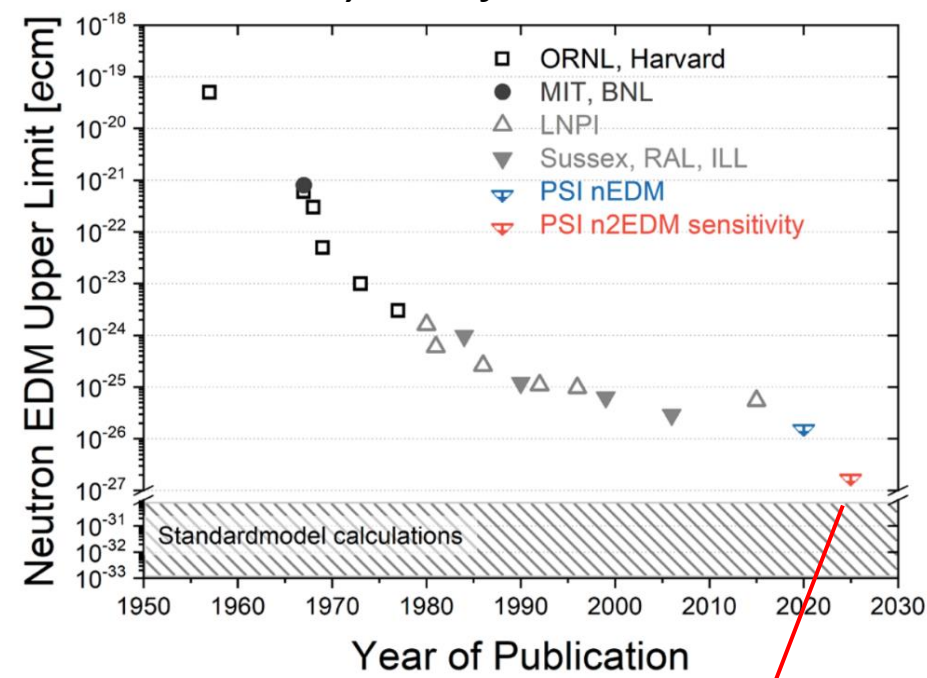

- Polarized UCNs precess in two chambers with opposite electric / magnetic configuration.
- If non-zero EDM, $f_n^{\text{TOP}} - f_n^{\text{BOT}} > 0$.
- f_n^{TOP} and f_n^{BOT} extracted from the asymmetry of \uparrow and \downarrow spin states after precession: « Ramsey method ».

The sensitivity of n2EDM

50 years of neutron EDMs

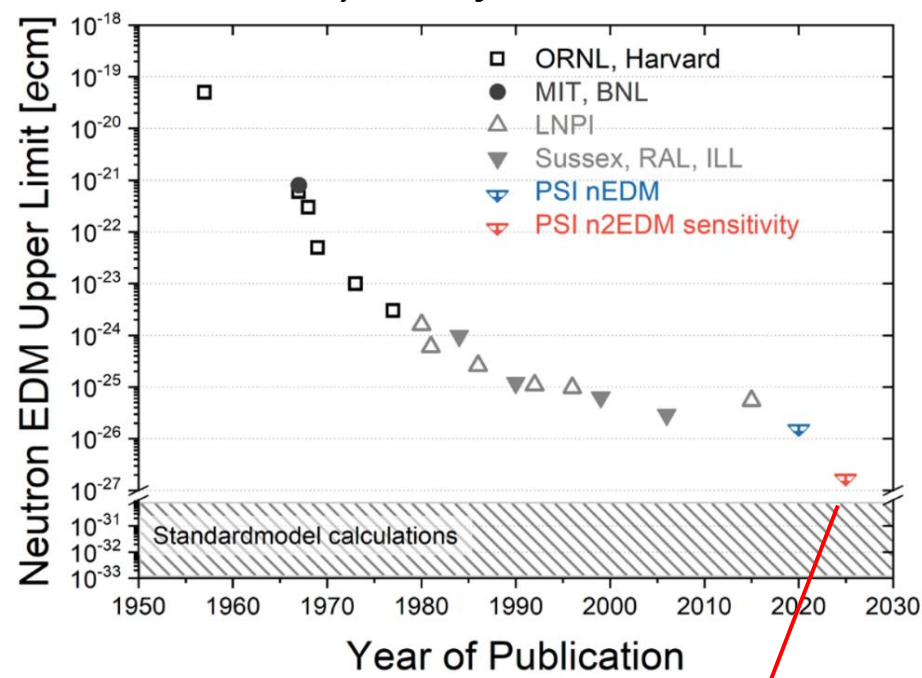

→ Current limit held by the nEDM collab

→ n2EDM d_n target sensitivity:

$1 \times 10^{-27} \text{ e.cm}$

The sensitivity of n2EDM

50 years of neutron EDMs

→ Current limit held by the nEDM collab

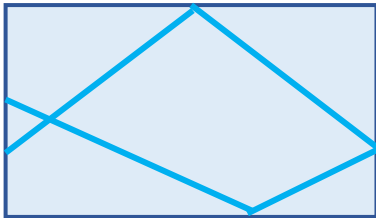

→ **n2EDM d_n target sensitivity:**

$1 \times 10^{-27} e.cm$

1) Maximizing the neutron statistics:

	nEDM 2016	n2EDM
Larger chambers → more UCNs		
Diameter D	47 cm	80 cm
N (per cycle)	15,000	121,000
T	180 s	180 s

UCNs with $v < 7\text{m/s}$ easily storable

The sensitivity of n2EDM

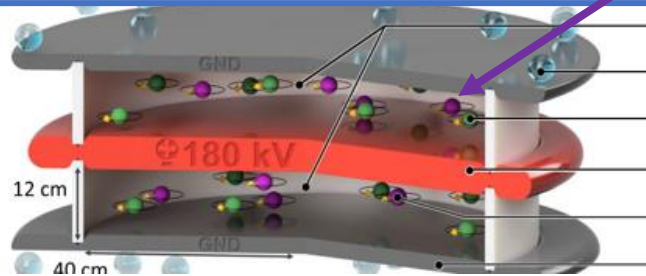

50 years of neutron EDMs

→ Current limit held by the nEDM collab

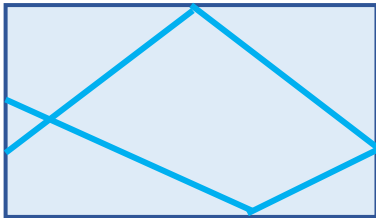

→ **n2EDM d_n target sensitivity:**

$1 \times 10^{-27} e.cm$

1) Maximizing the neutron statistics:

	nEDM 2016	n2EDM
Larger chambers → more UCNs		
Diameter D	47 cm	80 cm
N (per cycle)	15,000	121,000
T	180 s	180 s

UCNs with $v < 7\text{m/s}$ easily storable

2) Minimizing the magnetic field related systematics:

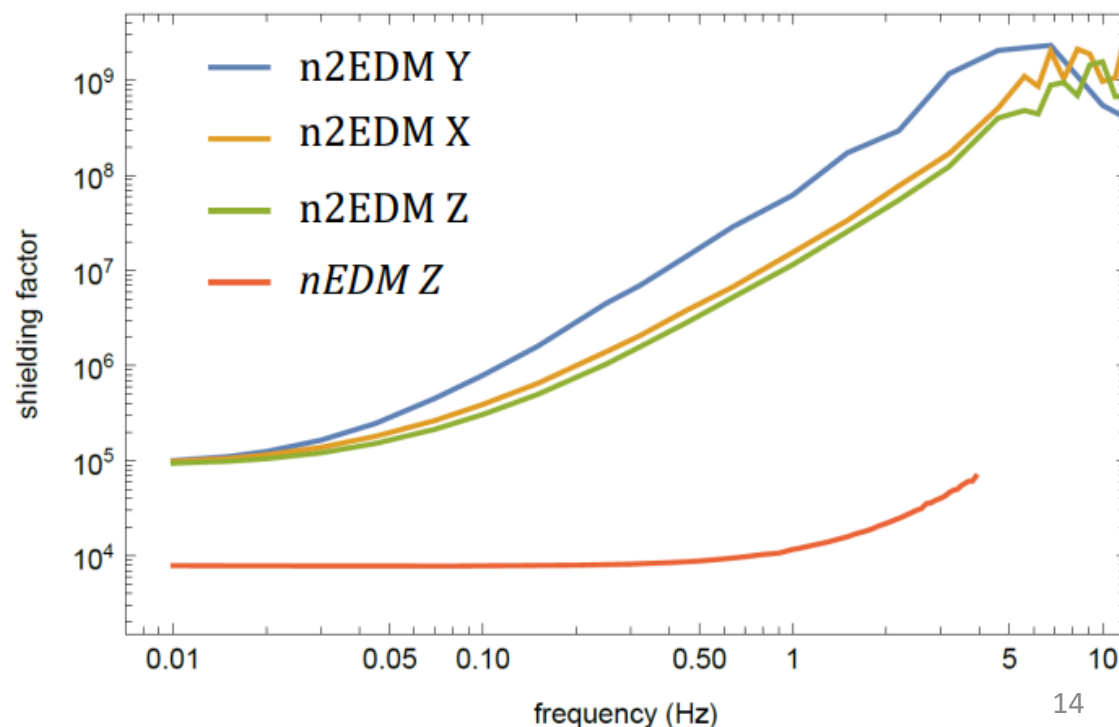

- **Mercury co-magnetometry** to compensate field fluctuations: measure $\mathcal{R} = f_n/f_{Hg}$ instead of f_n .
- **Active Magnetic Shield (AMS)** to cancel external fields.
- **Magnetic Shielding Room (MSR)** to suppress non-uniformities.

2020: commissioning of the Magnetic Shielding Room

The very large n2EDM magnetically shielded room with an exceptional performance for fundamental physics measurements, Ayres et al, Review of Scientific Instruments (2022).

- 6 layer of mumetal around a 25m^3 volume.
- 10^5 shielding factor at low frequency.
- Equipped with degaussing coils to reach residual field $< 100\text{ pT}$

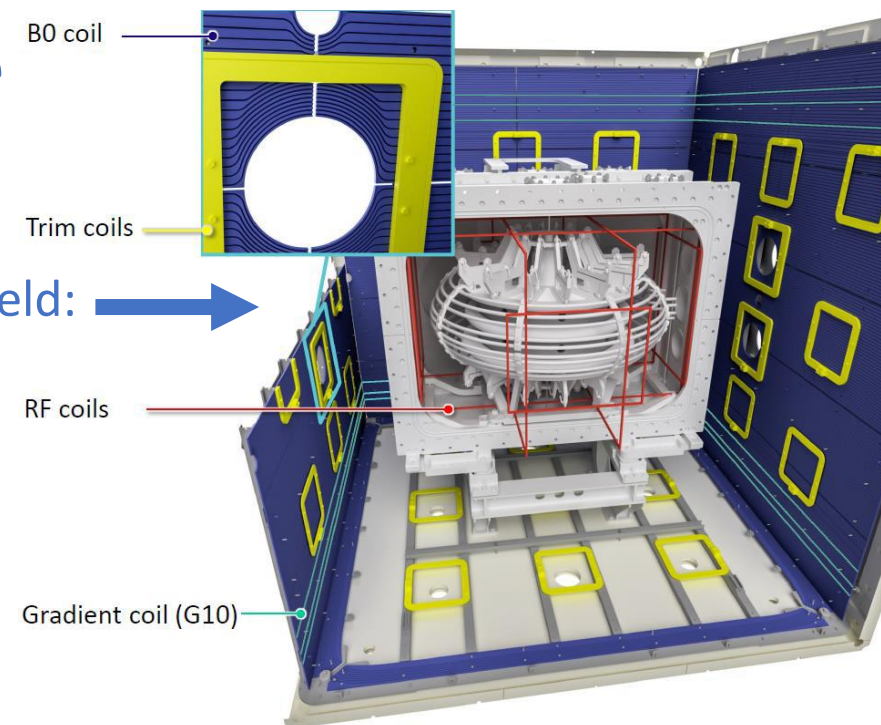

2022: commissioning of the B_0 field

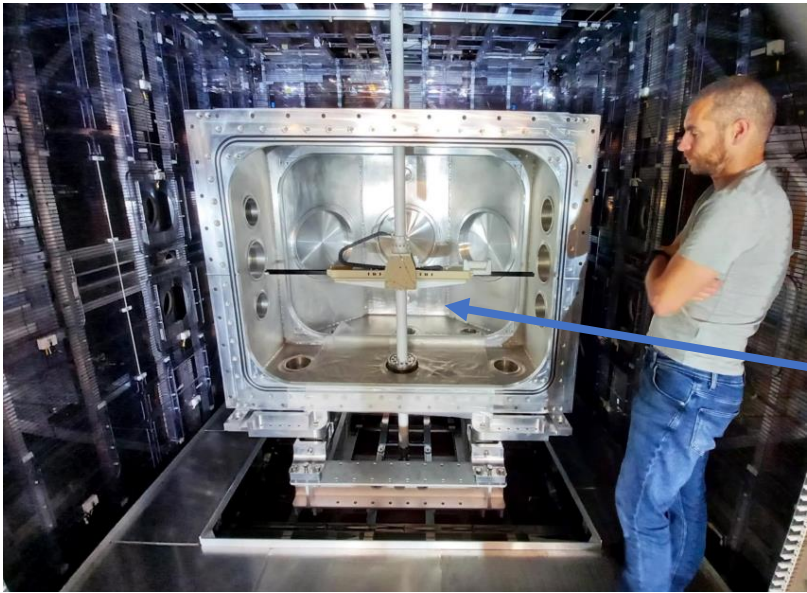

Coil system to produce uniform field:

- 1 main B_0 coil .
- 62 correcting coils.

.

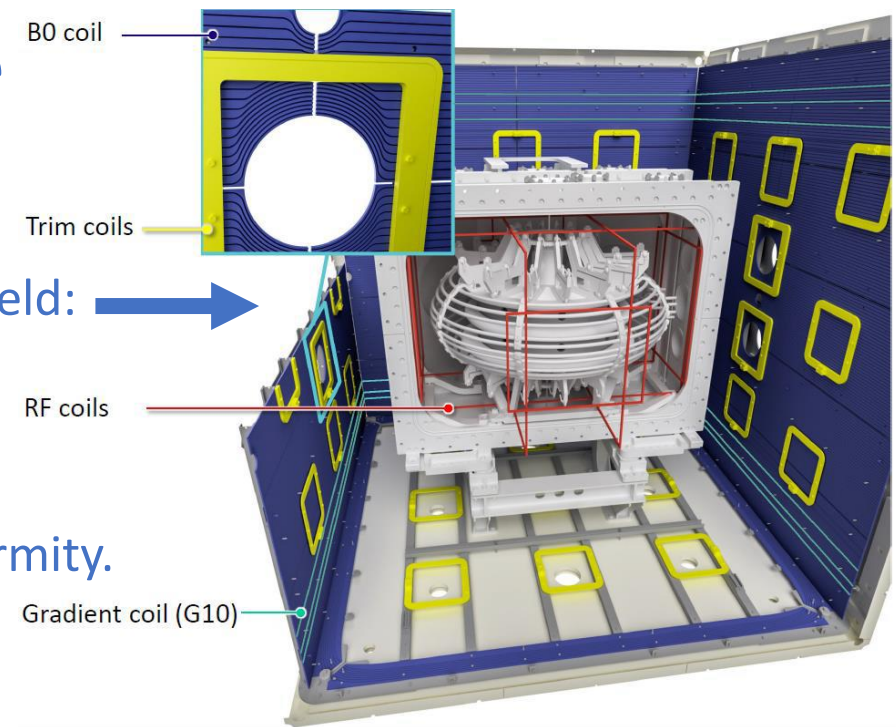

2022: commissioning of the B_0 field

Coil system to produce uniform field:

- 1 main B_0 coil .
- 62 correcting coils.

Robotic “**mapper**” to check uniformity.

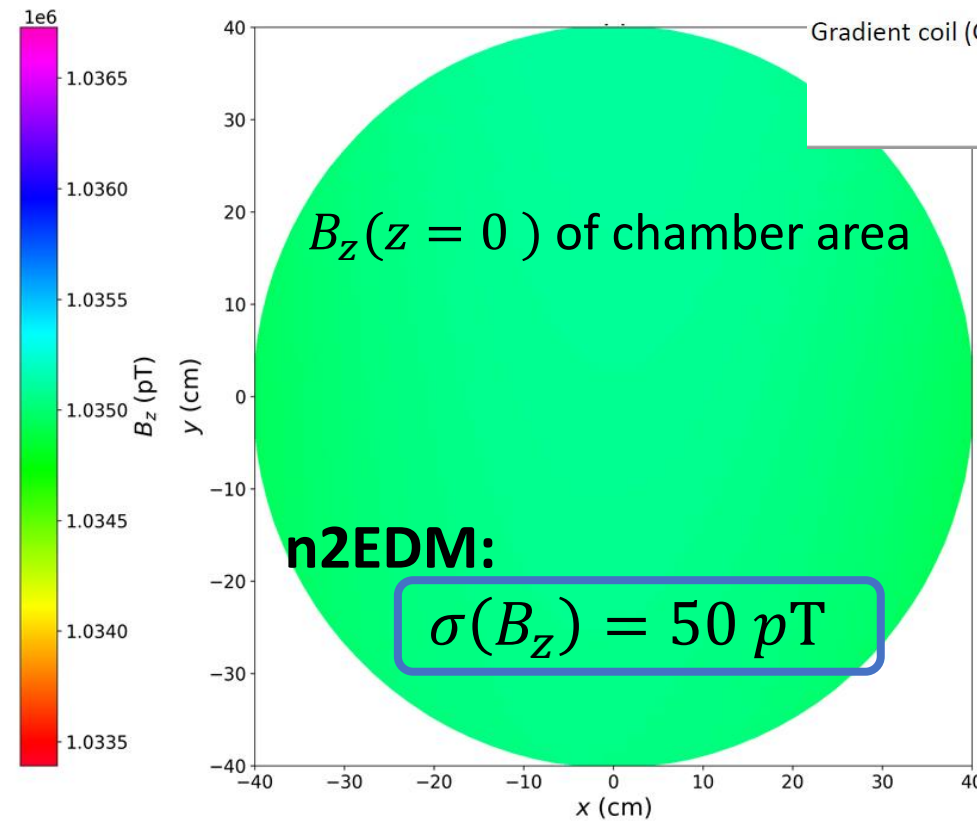

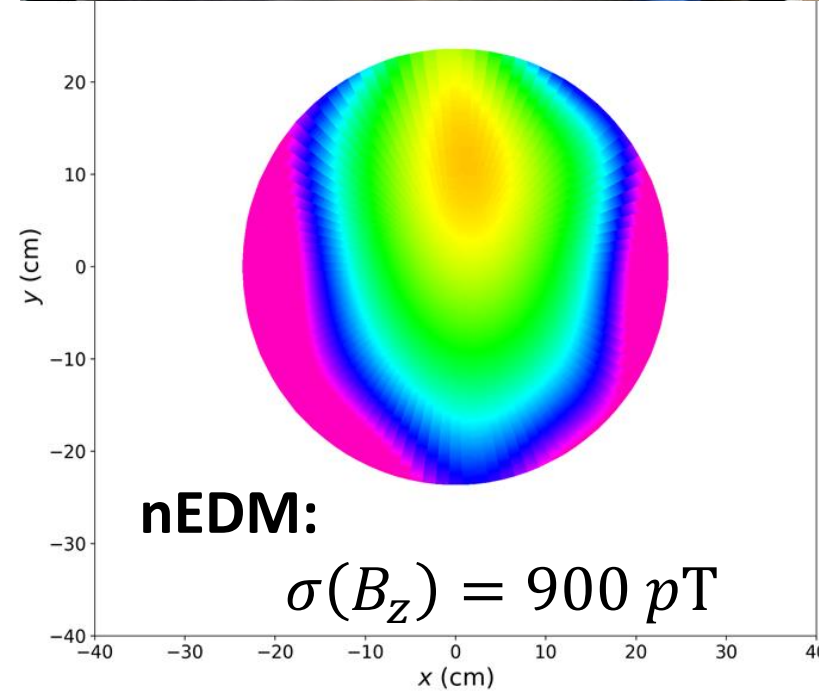

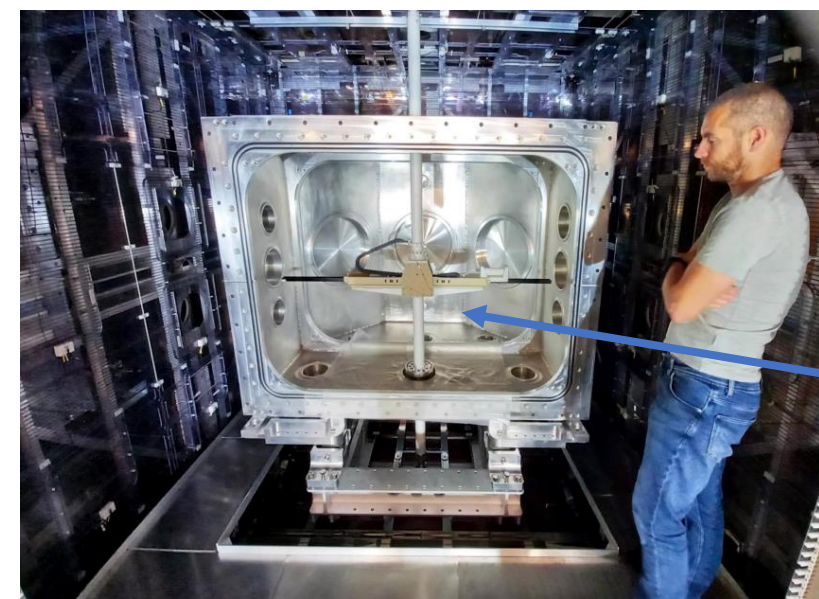

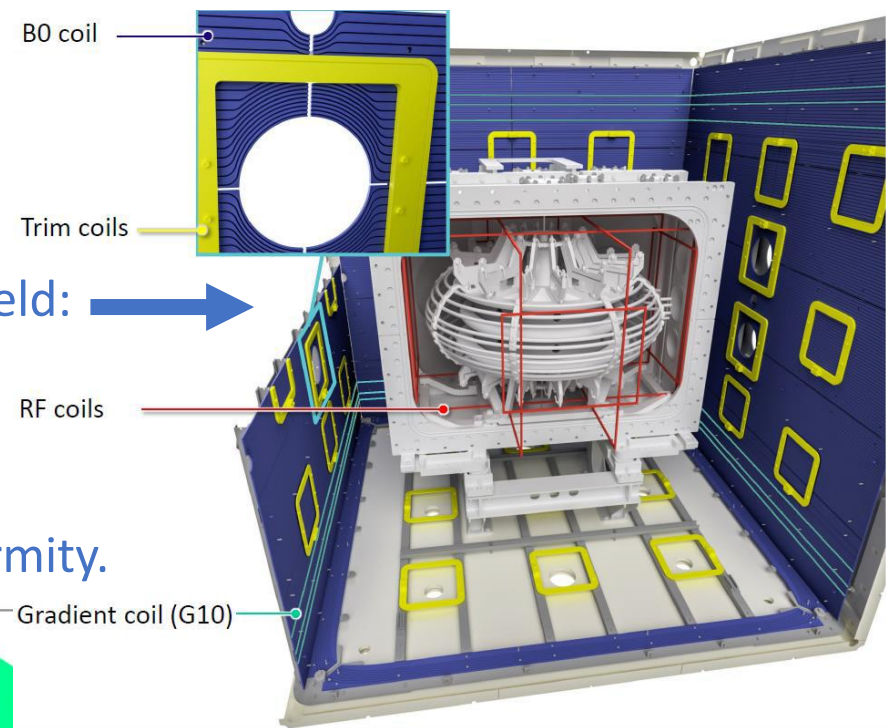

2022: commissioning of the B_0 field

Coil system to produce uniform field:

- 1 main B_0 coil .
- 62 correcting coils.

Robotic “mapper” to check uniformity.

- ✓ Record field uniformity.
- ✓ Satisfies systematical requirements to reach 10^{-27} e. cm sensitivity!

Conclusion and future prospects

n2EDM@PSI aims to reach unprecedented sensitivity on the neutron EDM thanks to:

- Efficient UCN production/transport and large storage volume.
- A remarkable control of magnetic field uniformity.

As of 2023:

- ✓ Magnetic shielding apparatus fully commissioned.
- ✓ Magnetic field ready for physics measurements.

Future prospects:

- UCNs in precession chambers in 2024.
- Start data taking in 2025.

Backup slides

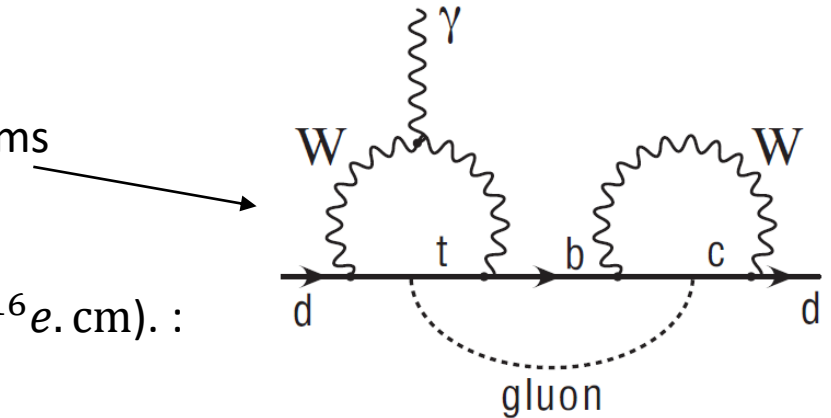

Formally: CP violating term (EM field and quark coupling)

$$\mathcal{L} = \frac{\mu}{2} \bar{f} \sigma_{\mu\nu} f F^{\mu\nu} - \frac{id}{2} \bar{f} \sigma_{\mu\nu} \gamma_5 f F^{\mu\nu} \quad \xrightarrow{CP} \quad \mathcal{L} = \frac{\mu}{2} \bar{f} \sigma_{\mu\nu} f F^{\mu\nu} + \frac{id}{2} \bar{f} \sigma_{\mu\nu} \gamma_5 f F^{\mu\nu}$$

$$H = -\mu \boldsymbol{\sigma} \cdot \mathbf{B} - d \boldsymbol{\sigma} \cdot \mathbf{E} \quad \xrightarrow{CP} \quad H = -\mu \boldsymbol{\sigma} \cdot \mathbf{B} + d \boldsymbol{\sigma} \cdot \mathbf{E}$$

In the Standard Model: ☹️

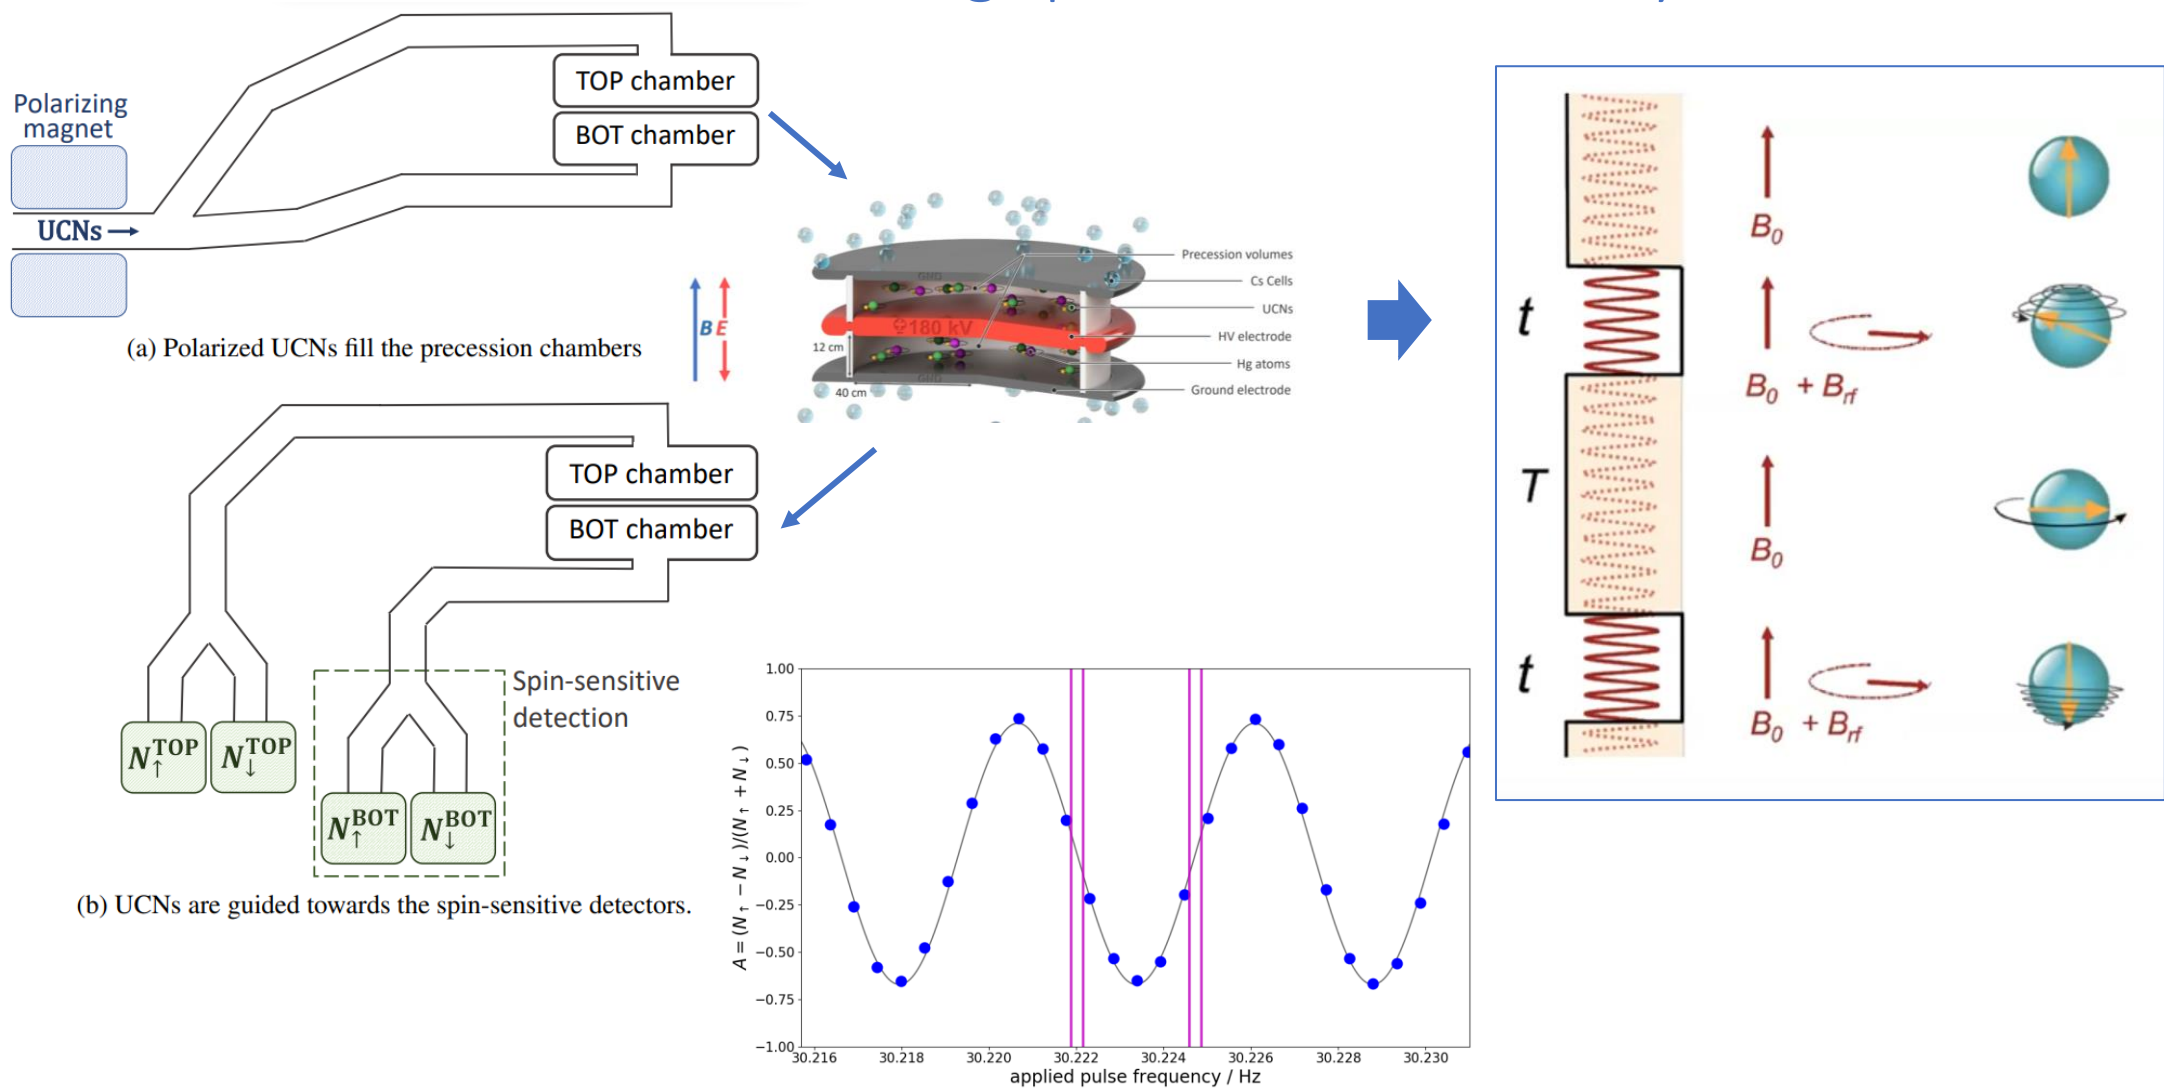

- CKM phase contribution to quark EDMs through at least 3 loops diagrams
→ very negligible ($d_n \sim 10^{-32} e \cdot \text{cm}$).
- QCD contribution $\frac{\alpha}{8\pi} \bar{\theta} G^{\mu\nu} \widetilde{G}_{\mu\nu}$ should generate huge EDMs ($d_n \sim 10^{-16} e \cdot \text{cm}$). :
current limit $d_n < 10^{-26} e \cdot \text{cm} \Rightarrow \bar{\theta} < 10^{-10}$ (strong CP problem).

Beyond the SM:

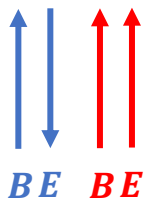

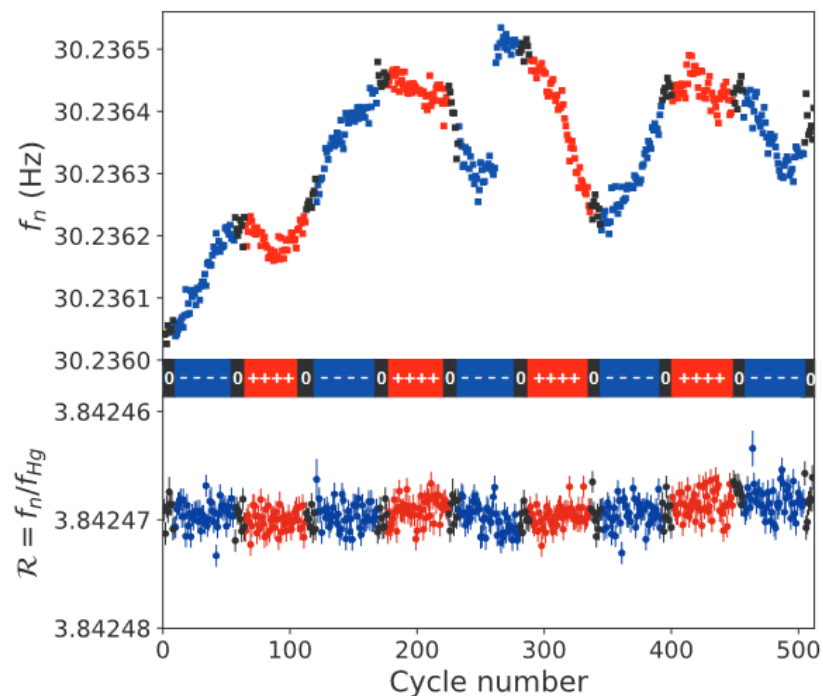

- (ex) modified Higgs-fermion Yukawa coupling $\mathcal{L} = -\frac{y_f}{\sqrt{2}} (\kappa_f \bar{f} f h + i \tilde{\kappa}_f \bar{f} \gamma_5 f h)$ generates EDM at 2 loops.

Counting spins with the Ramsey method

Up-down spin asymmetry $A \rightarrow$ precession frequency f_n

Hg co-magnetometry to compensate magnetic field fluctuations

Problem:

Uncertainty on f dominated by magnetic field fluctuations!

Solution:

Measure instead the ratio of mercury and neutron frequencies:

$$\mathcal{R} = \frac{f_n}{f_{Hg}} = \left| \frac{\gamma_n}{\gamma_{Hg}} \right| \mp \frac{|E|}{\pi \hbar f_{Hg}} d_n$$

Contribution from EDM

$$f_n = \left| \frac{\gamma_n}{2\pi} \right| B_0 \mp \frac{d_n}{\pi \hbar} |E|$$

No contribution from EDM!

$$f_{Hg} = \left| \frac{\gamma_{Hg}}{2\pi} \right| B_0$$

...which is free from the magnetic field fluctuations!

How do we parametrize the magnetic field?

Polynomial field expansion

$$\mathbf{B}(\mathbf{r}) = \sum_{l=0}^{+\infty} \sum_{m=-l}^l G_{lm} \Pi_{lm}(\mathbf{r})$$

Maxwell's equations
 $\nabla \cdot \mathbf{B} = 0$ and $\nabla \times \mathbf{B} = \mathbf{0}$

$$\mathbf{B}(\mathbf{r}) = \nabla \Sigma(\mathbf{r})$$

with

$$\Delta \Sigma(r, \varphi, \theta) = 0$$

Laplace equation in spherical coordinates

Harmonic modes $\Pi_{lm}(\mathbf{r})$
deduced from solutions
of Laplace equation

TABLE IV. The basis of harmonic polynomials sorted by degree in cylindrical coordinates.

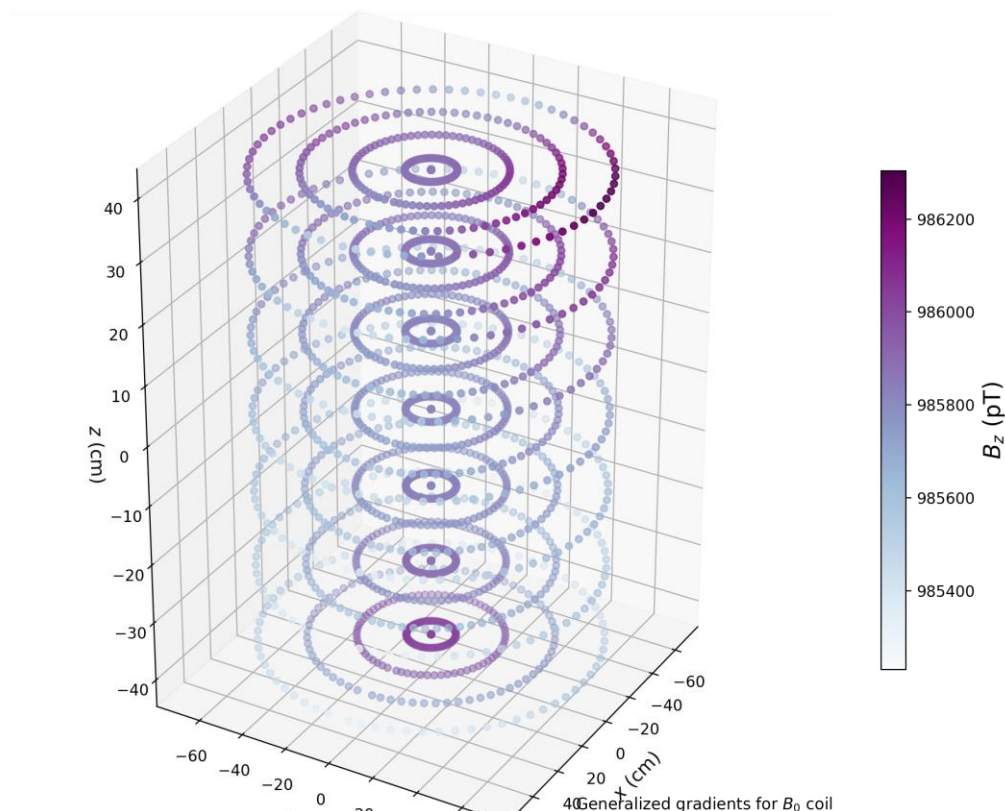

l	m	Π_ρ	Π_ϕ	Π_z
0	-1	$\sin \phi$	$\cos \phi$	0
0	0	0	0	1
0	1	$\cos \phi$	$-\sin \phi$	0
1	-2	$\rho \sin 2\phi$	$\rho \cos 2\phi$	0
1	-1	$z \sin \phi$	$z \cos \phi$	$\rho \sin \phi$
1	0	$-\frac{1}{2}\rho$	0	z
1	1	$z \cos \phi$	$-z \sin \phi$	$\rho \cos \phi$
1	2	$\rho \cos 2\phi$	$-\rho \sin 2\phi$	0
2	-3	$\rho^2 \sin 3\phi$	$\rho^2 \cos 3\phi$	0
2	-2	$2\rho z \sin 2\phi$	$2\rho z \cos 2\phi$	$\rho^2 \sin 2\phi$
2	-1	$\frac{1}{4}(4z^2 - 3\rho^2) \sin \phi$	$\frac{1}{4}(4z^2 - \rho^2) \cos \phi$	$2\rho z \sin \phi$
2	0	$-\rho z$	0	$-\frac{1}{2}\rho^2 + z^2$
2	1	$\frac{1}{4}(4z^2 - 3\rho^2) \cos \phi$	$\frac{1}{4}(\rho^2 - 4z^2) \sin \phi$	$2\rho z \cos \phi$
2	2	$2\rho z \cos 2\phi$	$-2\rho z \sin 2\phi$	$\rho^2 \cos 2\phi$
2	3	$\rho^2 \cos 3\phi$	$-\rho^2 \sin 3\phi$	0

So what do we measure? The *generalized gradients* G_{lm} :

- “Online” with mercury co-magnetometry and cesium magnetometers.
- “Offline” with the mapper.

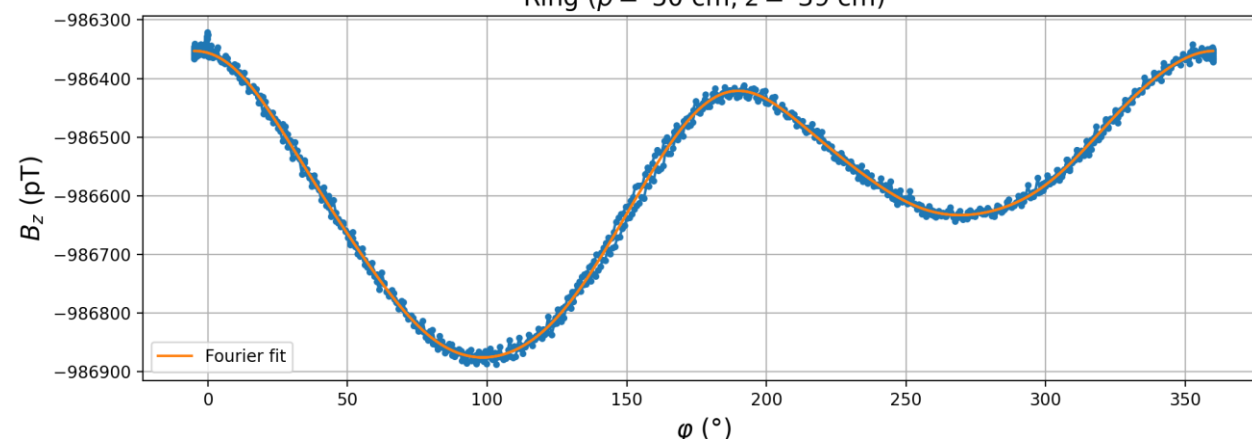

Reminder: extraction of the harmonic spectrum

1) Do cylindrical map $B_z(\rho, \varphi, z)$ 

2) Fit rings with fourier series:

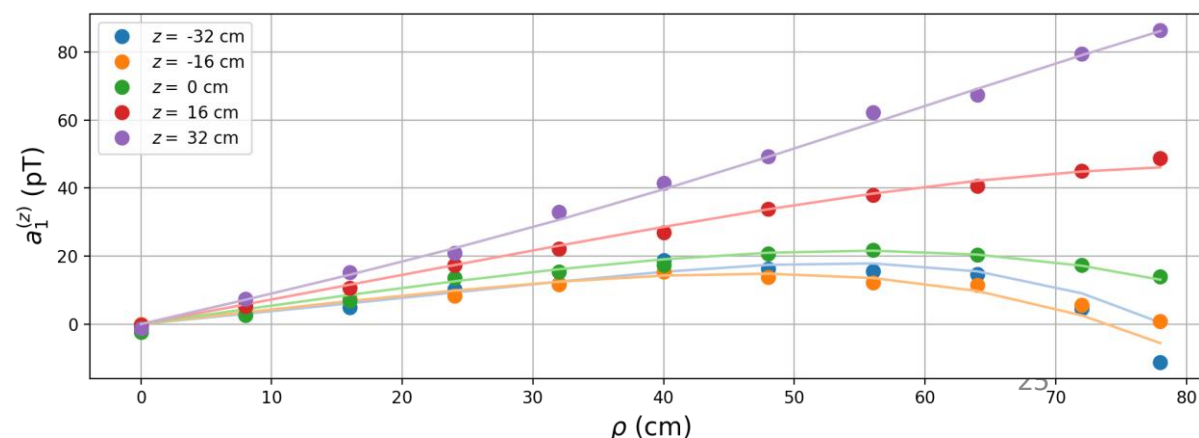

$$B_z(\rho, \varphi, z) = \sum_{m \geq 0} a_m^{(z)}(\rho, z) \cos(m\varphi) + b_m^{(z)}(\rho, z) \sin(m\varphi)$$

Ring ($\rho = 50$ cm, $z = 39$ cm)

3) Fit fourier coefficients with harmonic polynomial:

$$a_m^{(z)}(\rho, z) = \sum_{l \geq 0} G_{lm} \hat{\Pi}_{lm}(\rho, z)$$

4) Get G_{lm} spectrum
