

# MDT Performance in 7 TeV Data

**Look at hardware, software, and calibrations of MDT's in collision data.**

**Today, will concentrate on residuals and resolutions.**

# Data Sets

Have looked at two data sets:

1. Original processing of an early run (155112).  
Includes  $t_0$  fitting and larger resolution.
2. Reprocessing by Muon Combined Performance group  
of large data set, selected for Z's.  
No  $t_0$  fit, smaller resolution.

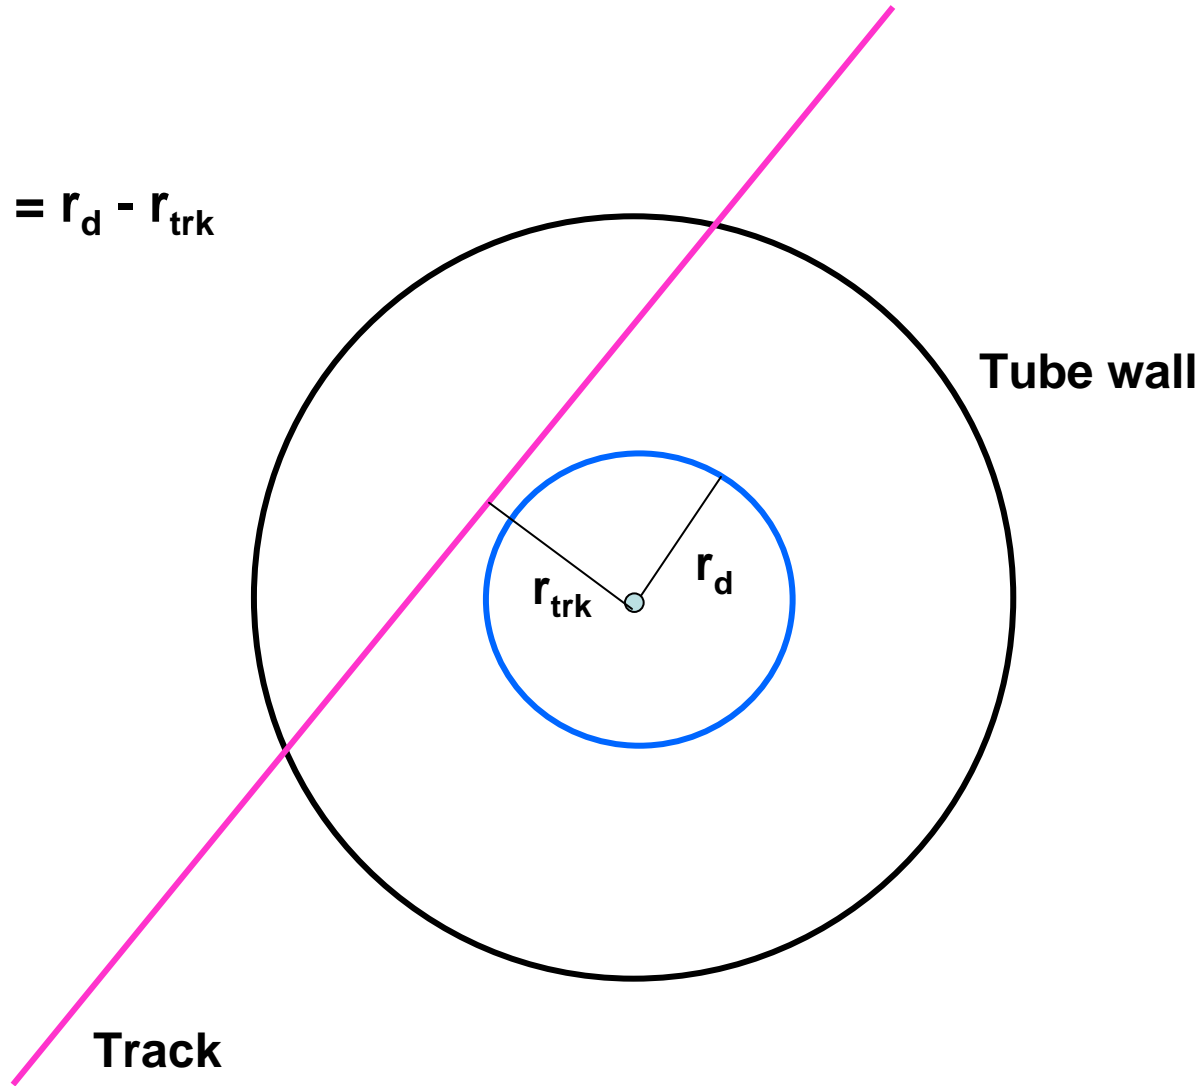

# Muon Selection

1. Muid combined (author 12). [I have also looked at Staco muons for a subset of the reprocessed data and the results are similar.]
2. ID track requirements:
  - A.  $P > 5 \text{ GeV}/c$
  - B.  $N_{\text{pixel}} > 1$
  - C.  $N_{\text{SCT}} > 5$
3. Only look at segments where all hits are in the same chamber.
4. For reprocessed data, require two muons who invariant mass is consistent with a Z.

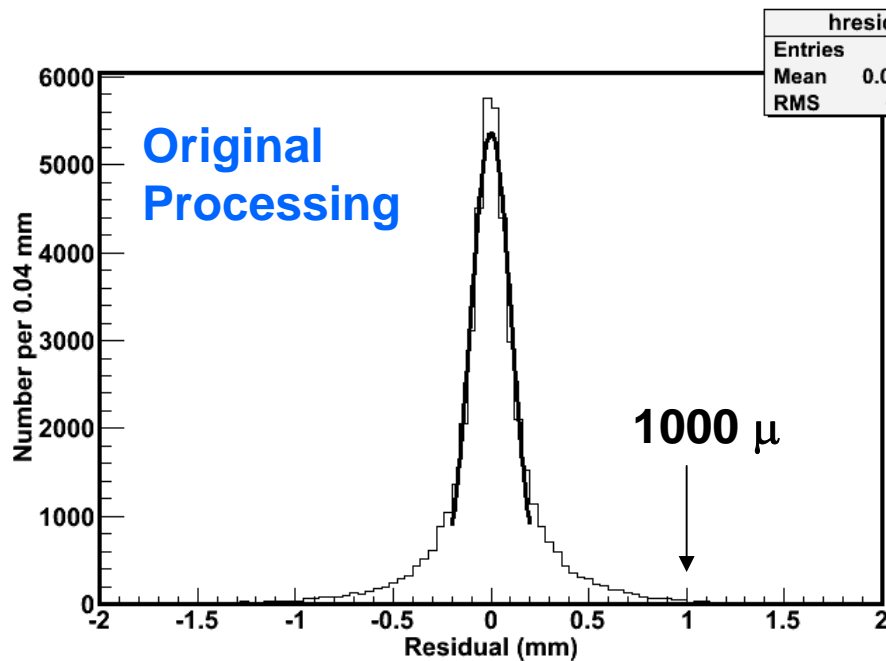

# Residuals

$$\text{residual} = r_d - r_{\text{trk}}$$

# Residuals

Residual (mm)

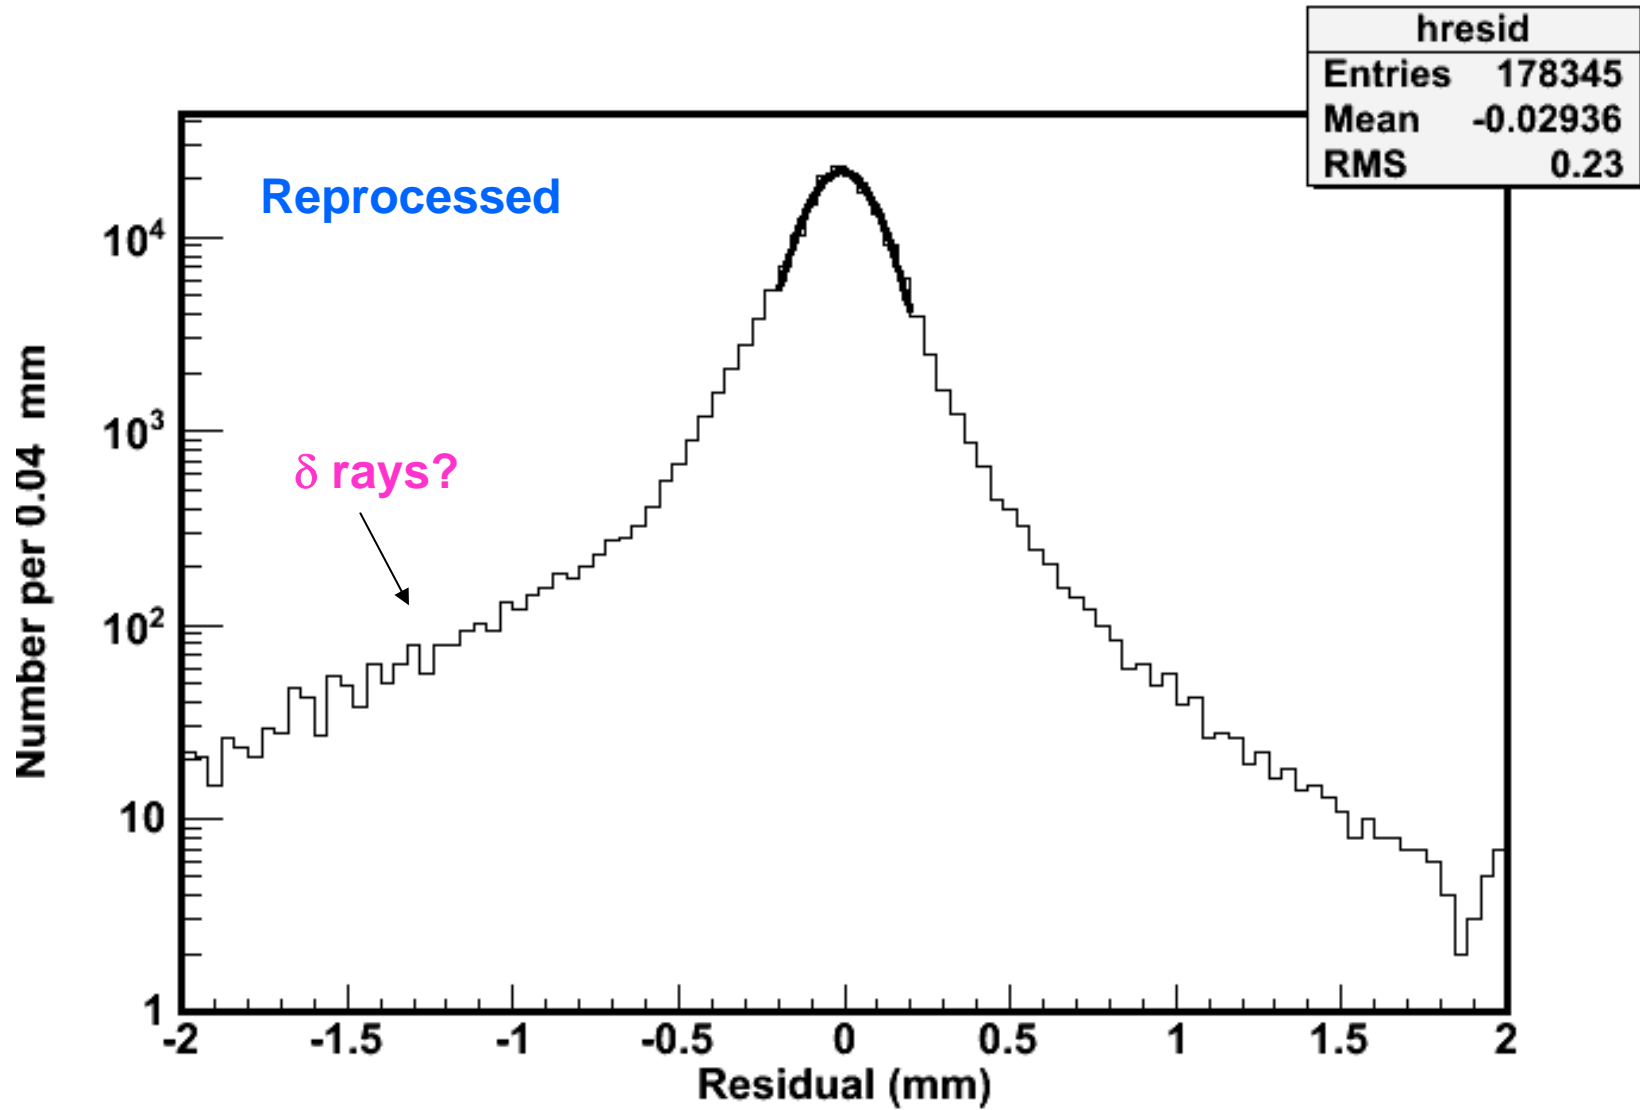

fit mean =  $0.25 \pm 0.67 \mu$   
fit  $\sigma$  =  $104.5 \pm 0.7 \mu$   
rms =  $302 \mu$

Residual (mm)

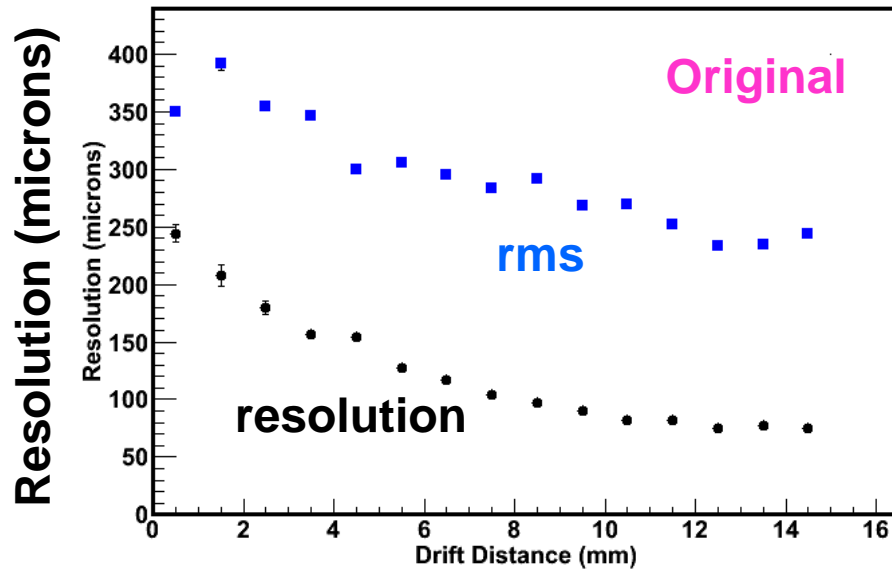

fit mean =  $-7.51 \pm 0.36 \mu$   
fit  $\sigma$  =  $112.3 \pm 0.4 \mu$   
rms =  $230 \mu$

# Residuals

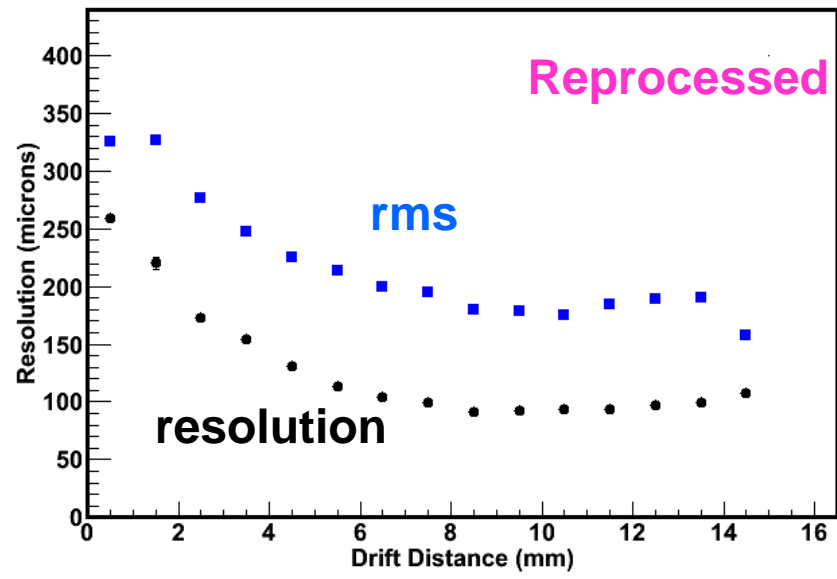

# Resolution vs r

Histogram residuals in bins of drift distance. Fit narrow core to Gaussian. Plot resolution (width of Gaussian) vs drift distance.

Drift Distance (mm)

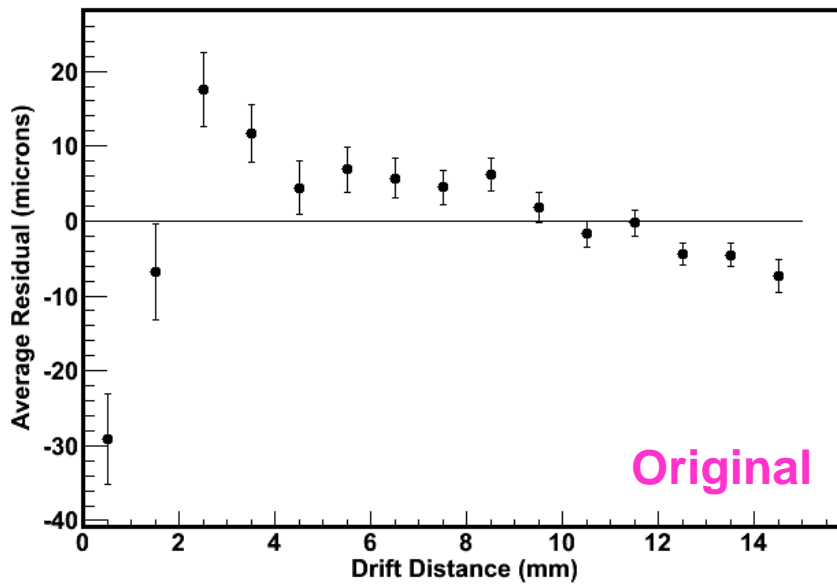

Drift Distance (mm)

# Average Residual vs r

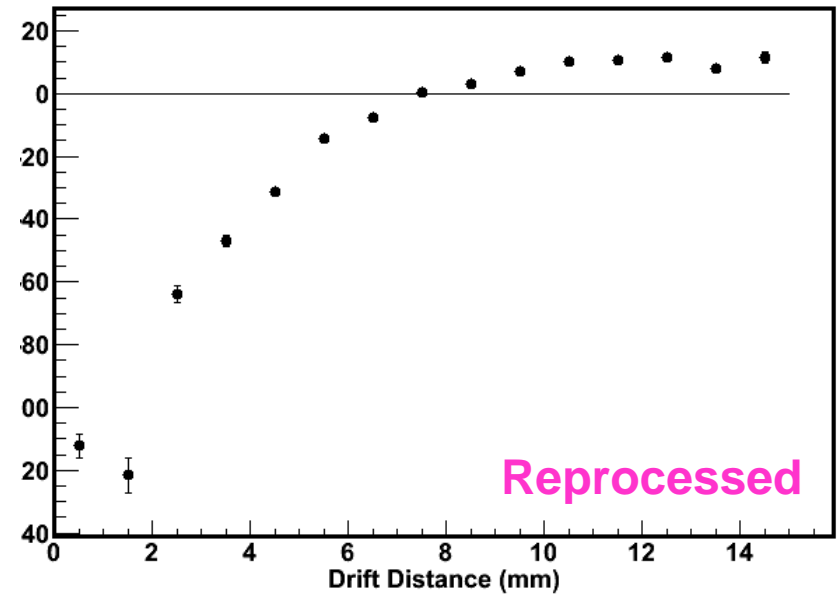

Histogram residuals in bins of drift distance. Fit narrow core to Gaussian. Plot mean of Gaussian vs drift distance.

Average Residual (microns)

Original

# Good Segment

Run 162882 Event 63034830 Station 1 phi 3 eta -1

**Chamber View**

Run 162882 Event 63034830 Station 1 pt

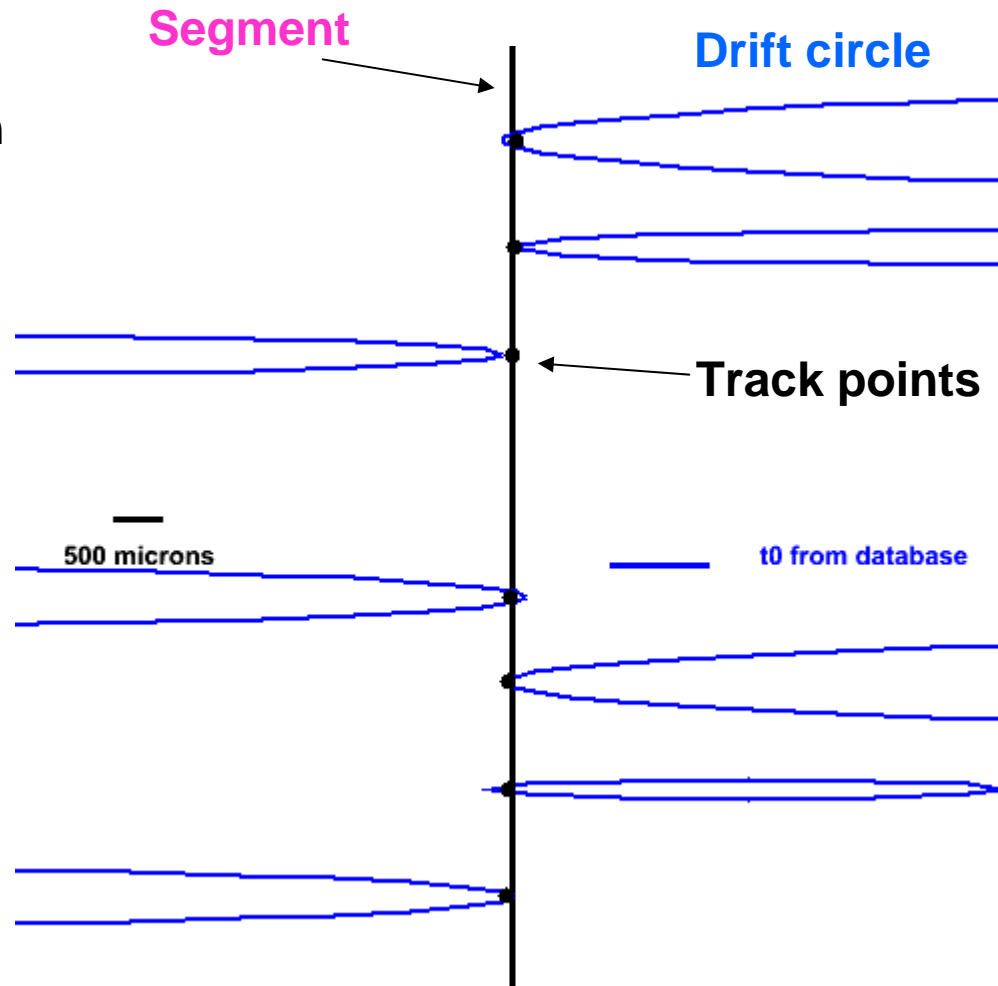

**Zoomed View**

# Good Segment

Exploded View –  
make segment  
vertical and expand  
horizontal dimension

Reprocessed

# Bad Segment

Same muon but  
different chamber  
as last slide.

# Bad Segment II

Same event but different muon as last slide.

Same as left, but reduce each drift distance by  $1000 \mu$ .

# Bad Segment III

Same muon but different chamber as last slide.

# Bad Segment IV

Same muon but different chamber as last slide.

# Summary

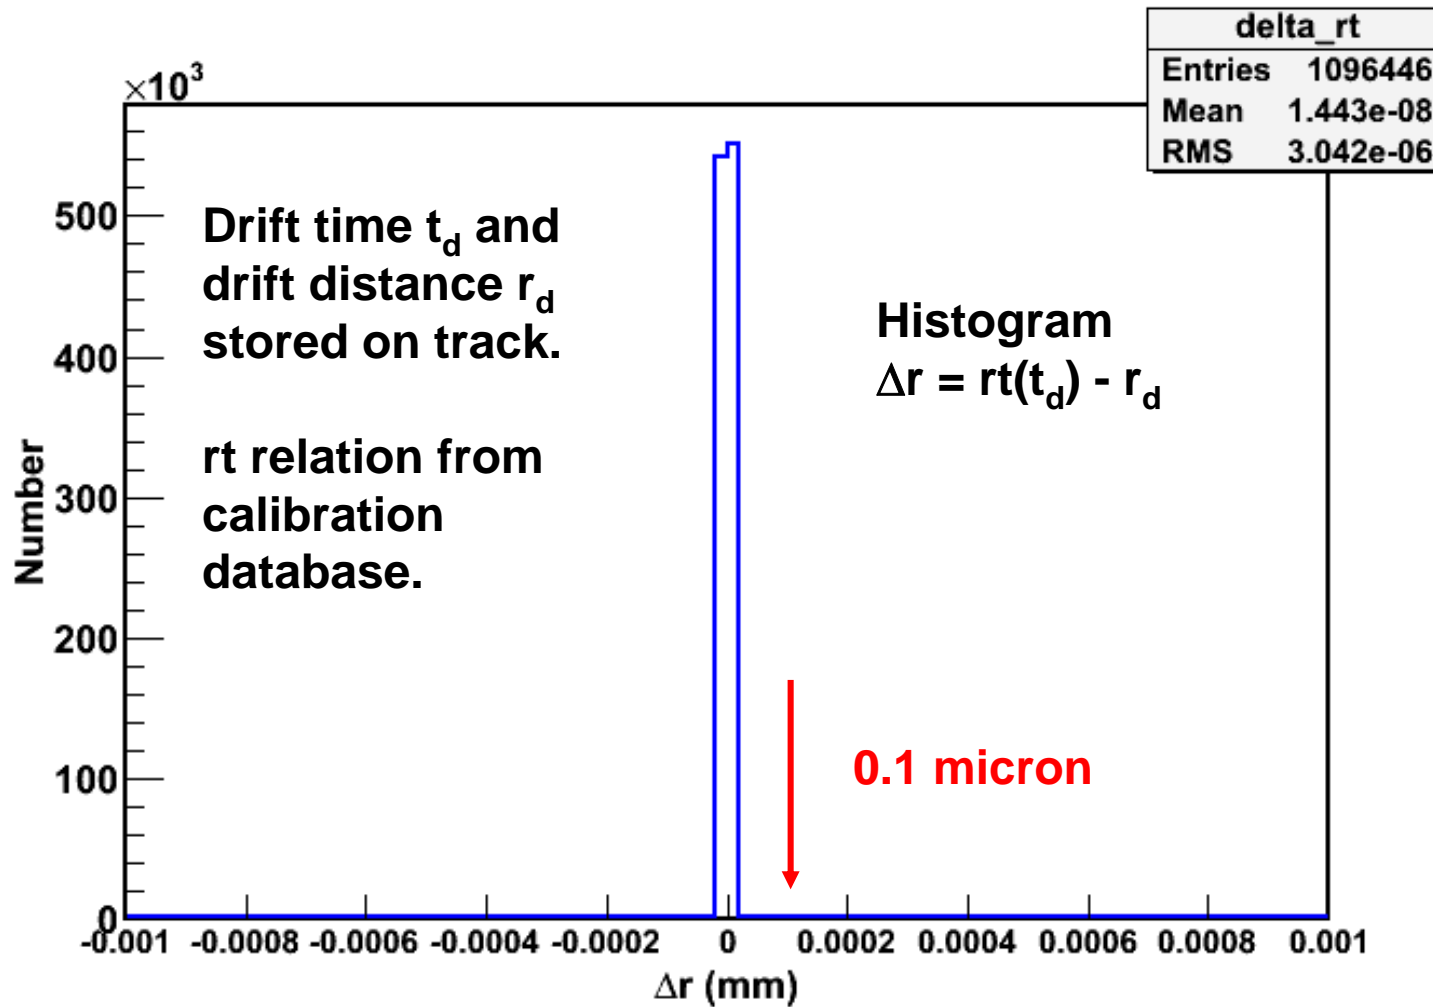

**Not doing  $t_0$  fit and tightening hit selection have reduced but not eliminated tails on residuals.**

**Selection of hits on tracks,  $t_0$  calibration, and  $rt$  relations need to be looked at carefully.**
