

# Experimental validation of the Resolution Function @ EAR2

J. Lerendegui, V. Alcayne, J.A. Pavón  
on behalf of the Resolution Function -WG

- **Review of status of last meetings**

**Links:**

[Nov '21 \(JLM\)](#)

[May '22 \(ND2022, JAP\)](#)

- Recent progress in the data analysis

- RF from FLUKA simulations & transport code

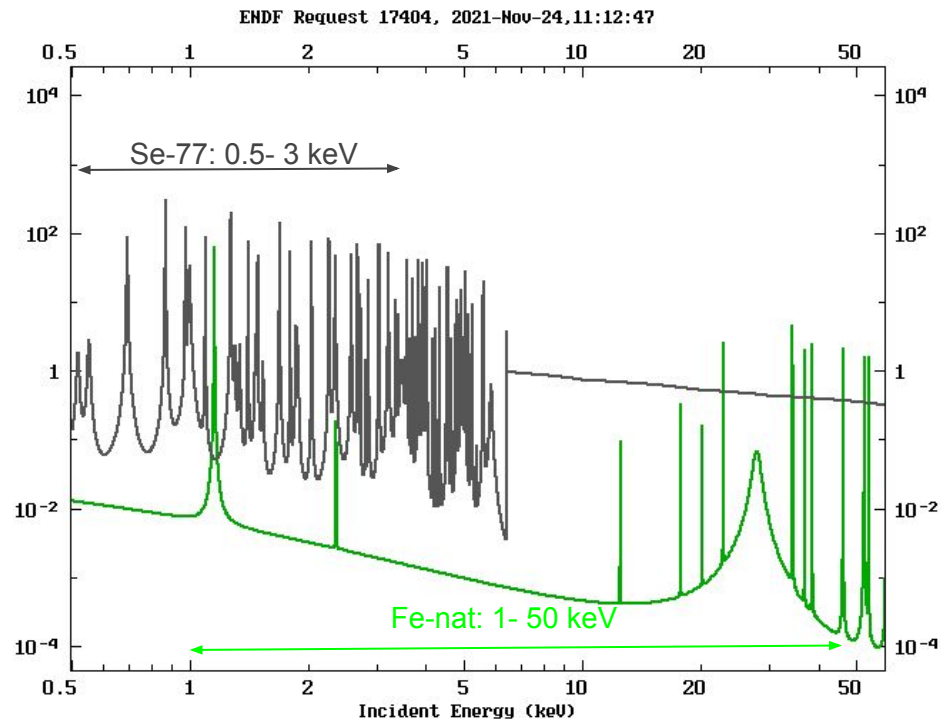

- Analysis with SAMMY

- Results of the validation

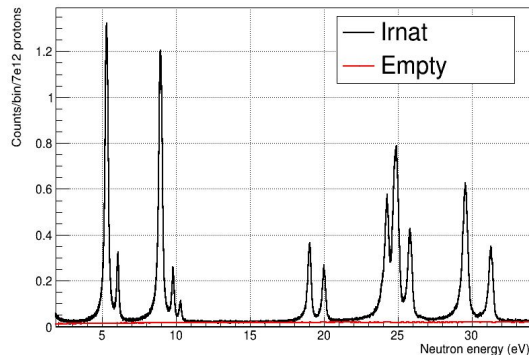

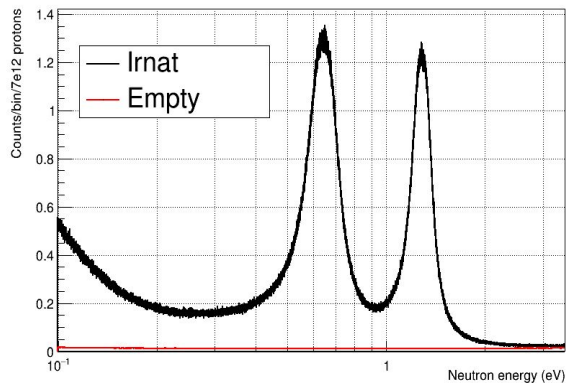

## Setup #1: Detectors at 30 cm

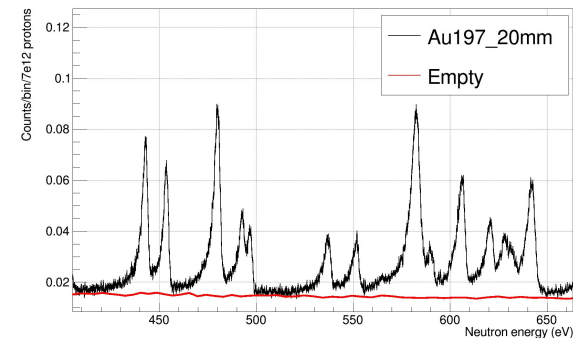

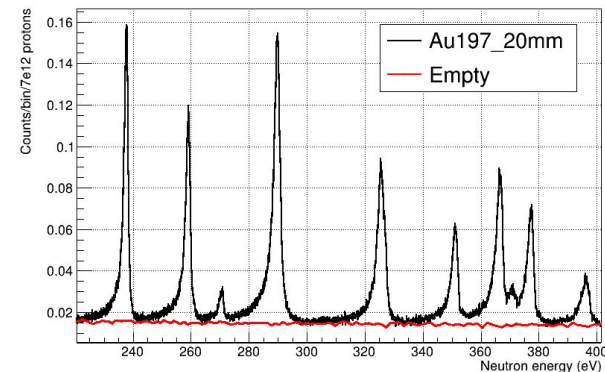

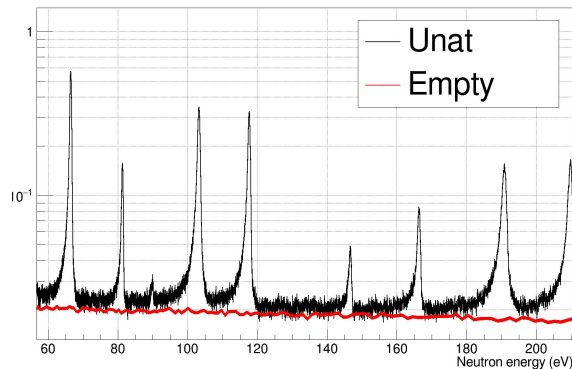

## Setup #2: Detectors at 15 cm

## SETUP #1: detectors at 30 cm

Validation of RF up to  
60-600 eV

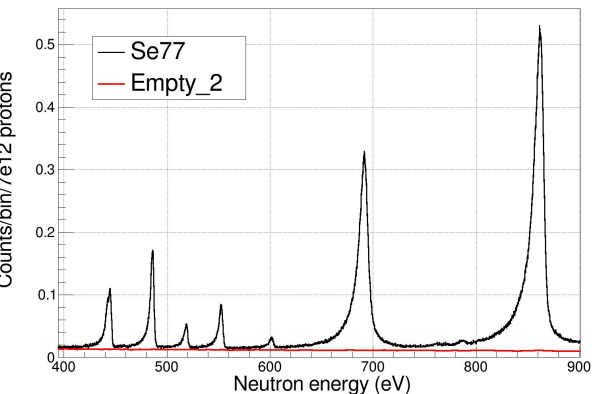

# Data for the RF @ EAR2: Setup #2

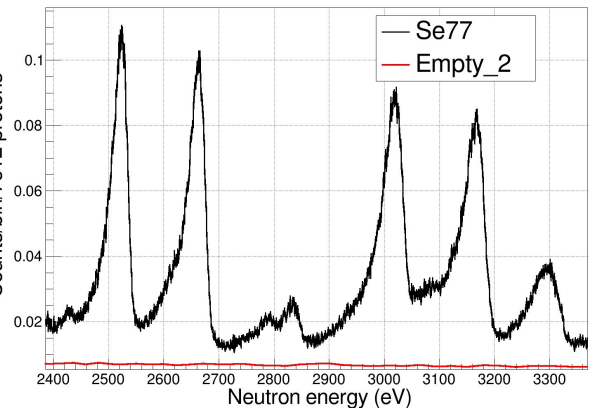

## SETUP #2: detectors at 15 cm

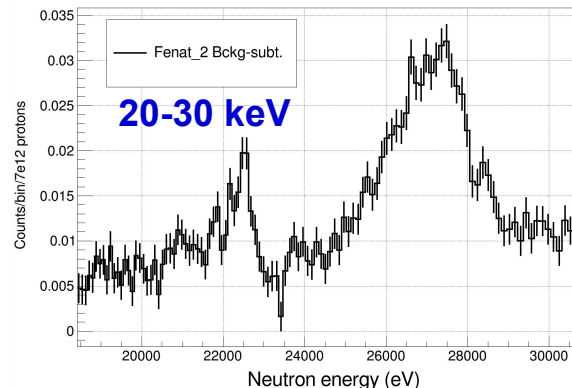

**Se-77**

Validation of  
RF >500 eV

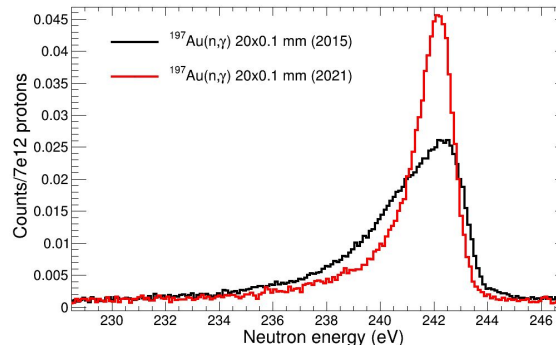

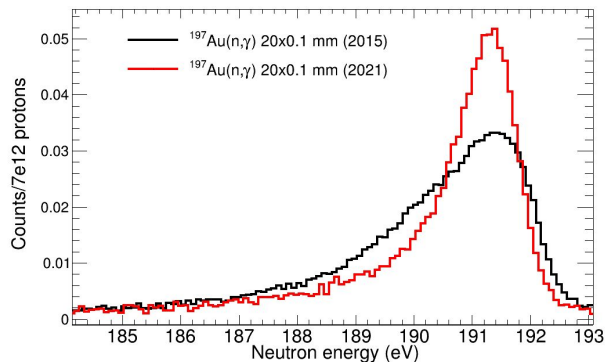

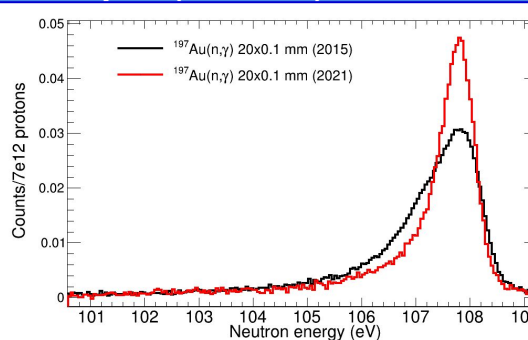

**Fe-nat**

SBR and  
statistics  
were  
limited for  
Fe-nat

## Same Au-20mmx0.1mm sample (ID = 170)

Normalized to the area of each resonance to compare the shape

Despite the non-final analysis, the improvement in terms of RF seems clear in different energy ranges

- (n,g) measurements at EAR2 → RRR in the energy range from 0.5eV to 30 keV.
- Two different setups :
  - Ensure the correct performance of the detectors in terms of C. rates.
  - Sufficient S/B ratio for the samples with resonances in the keV range.
- Up to now: Preliminary analysis & PSA parameters improvement.
- (n,g) data ready to validate the RF in a wide energy range.
- Comparison 2015: RF improved & (now) no significant shape change with small samples.
- Additional: Preliminary confirmed 2-3mm shift of the center of the beam for low energies.

- Final analysis and yield extraction: Preliminary flux shape is required (already available but not yet done)
- FLUKA + MNCP (**now FLUKA v.4.3**) simulations have been improved and massive production are launched
- After simulations are ready: Validation (**Time depends on the level of agreement**)
  - Direct comparison Exp data vs (n,g) TOF yield from transport code
  - Numerical RF to SAMMY

- Review of status of last meeting
- **Recent progress in the data analysis**
- RF from FLUKA simulations & transport code
- Analysis with SAMMY
- Results of the validation

- Final analysis and yield extraction with preliminary flux shape

Divide by

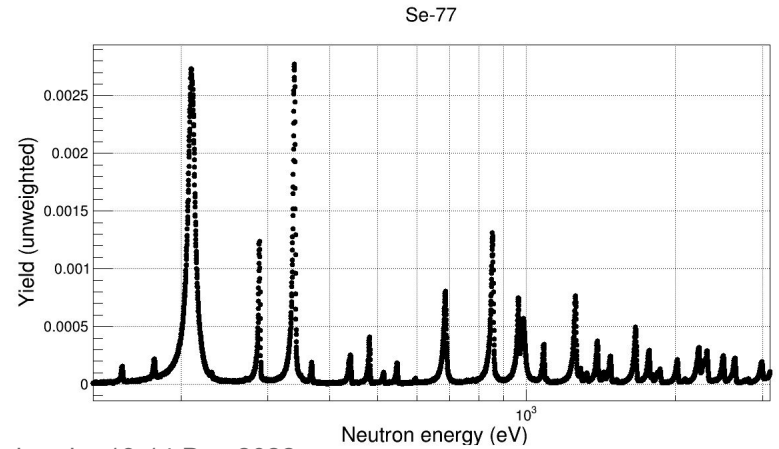

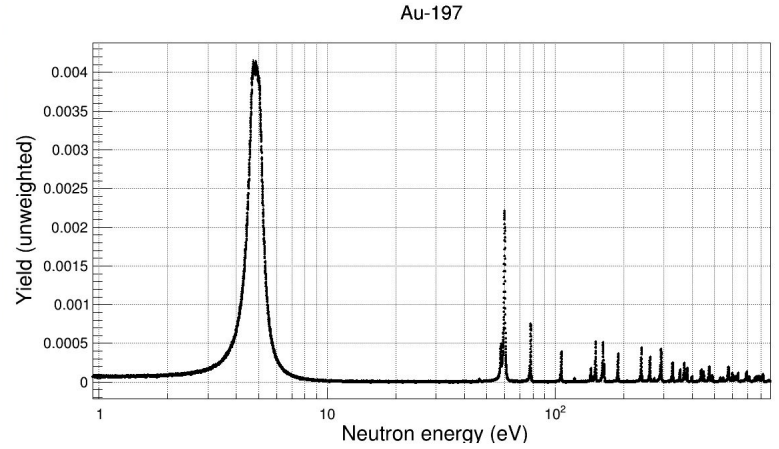

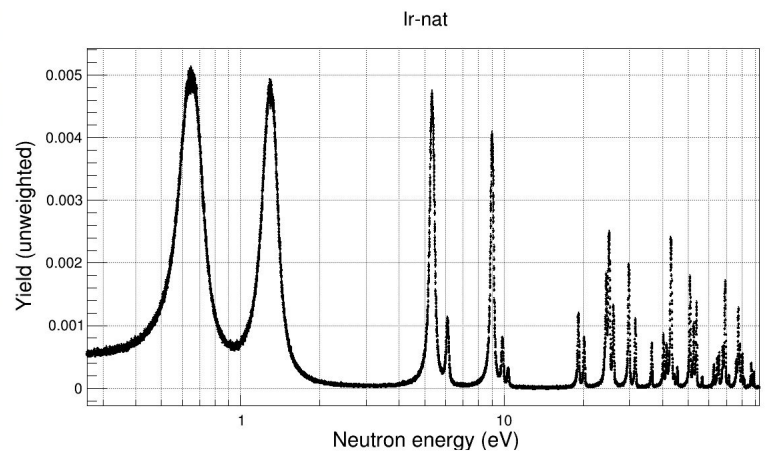

Background-subtracted  
unweighted Counts vs TOF

+ T2E conversion (fixed  
 $L_0 = 19.51$  m)

Preliminary Flux  
shape EAR2

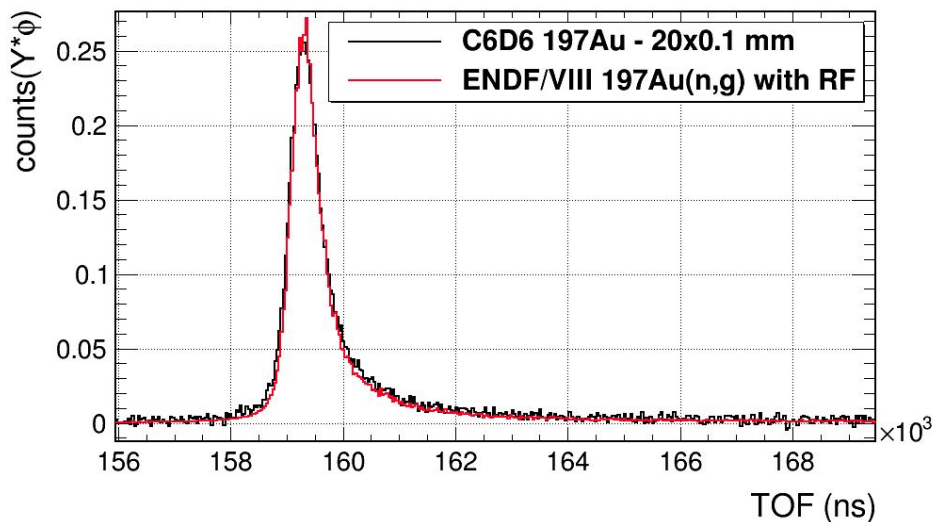

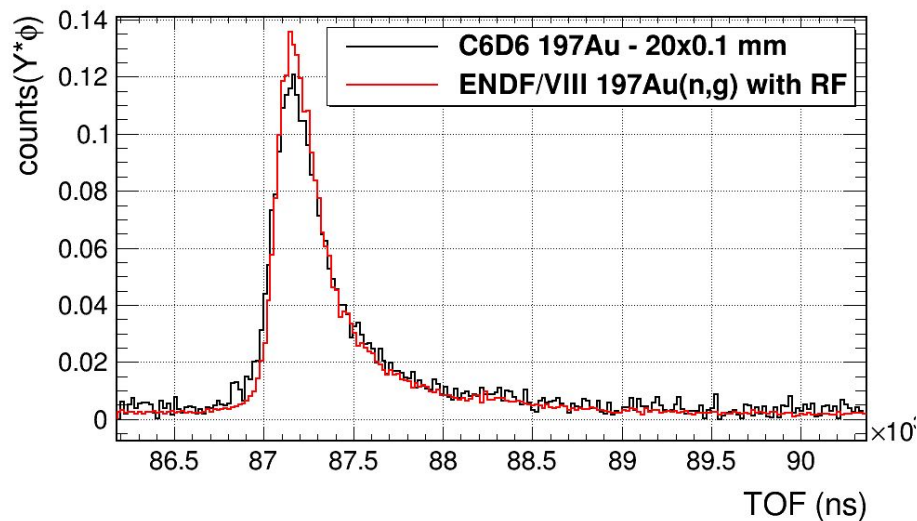

# RF @ EAR2: Progress in data analysis / quality

- Review of status of last meeting
- Recent progress in the data analysis
- **RF from FLUKA simulations & transport code**
- Analysis with SAMMY
- Results of the validation

## Background subtracted c. rates vs TOF vs FLUKA simulations + T. Code

- Extract the flightpath for the RF
- first validation of the RF vs experimental data

**Geometrical flightpath (TC) = 19.81 m +  
preliminary validation of the RF → good agreement between data & calculation in shape and the tail**

- Review of status of last meeting
- Recent progress in the data analysis
- RF from FLUKA simulations & transport code
- **Analysis with SAMMY**
- Results of the validation

- Fe-nat re-measured in 2022 with STEDs for higher SBR

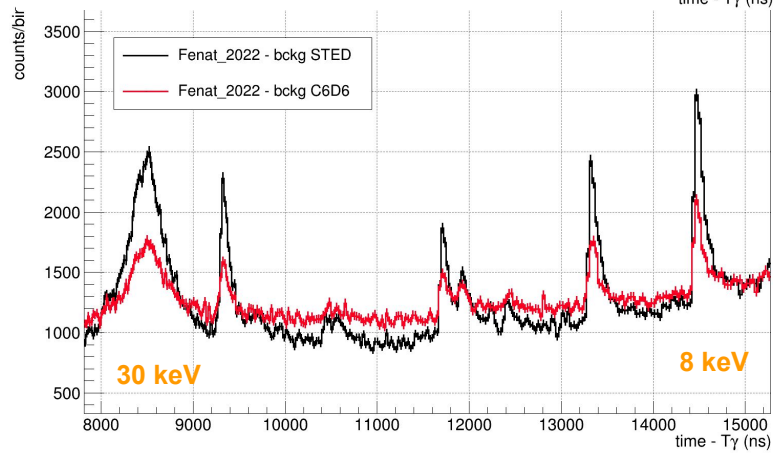

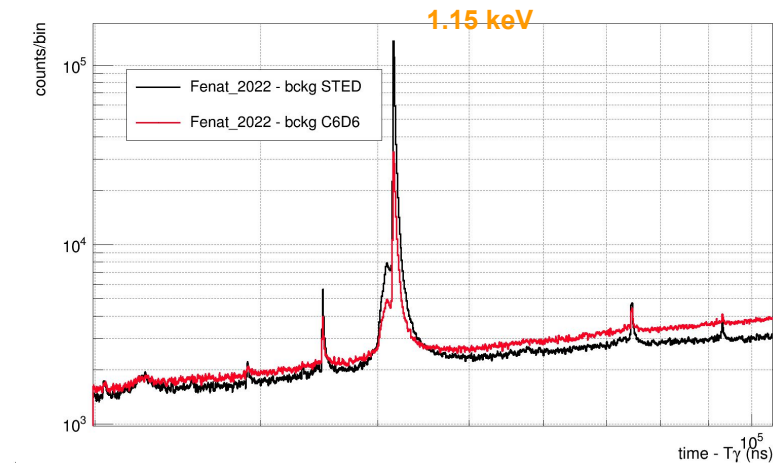

**2022 RF Fe-nat measurement :**  
20 x 2 mm sample mounted on  $^{79}\text{Se}$  empty  
(2021: 20 x 1 mm)

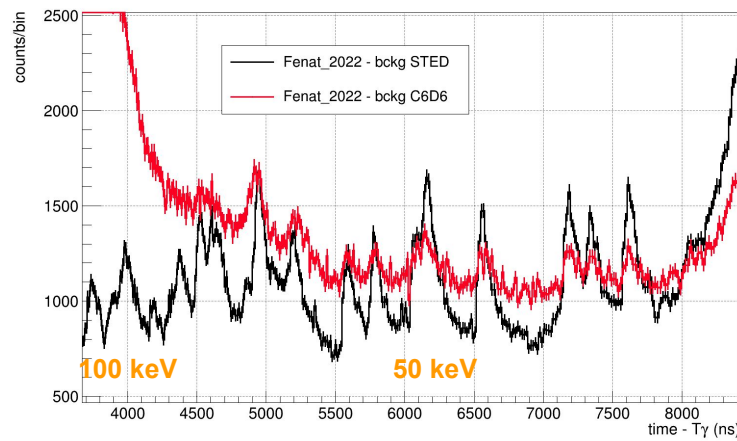

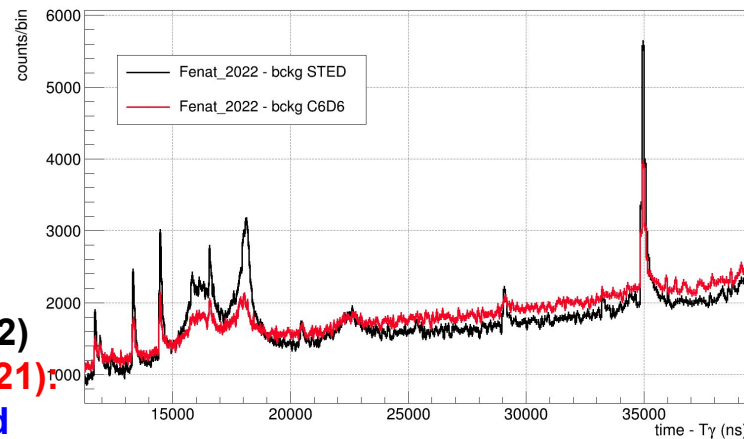

- Same setup than Nb-94, Se-79 campaigns
- 9 sTEDs @ 4.5 cm
- 2 C6D6 @ 17 cm
- 1 LaCl3 @ 9 cm

**Setup with enhanced efficiency and SBR to improve the quality of the Fe-nat data for the RF @ 10-100 keV**

- Fe-nat re-measured in 2022 with STEDs for higher SBR:

**STED (2022)**  
**vs C6D6 (2021):**  
**Enhanced**  
**SBR!**

# RF @ EAR2: Analysis with SAMMY

1) Prepared input files and data files in SAMMY format:  
JEFF-3.3 (+ N. Sosnin et al. for  $^{77}\text{Se}$ )

RF WORK DIRECTORY:  
`/eos/experiment/ntof/2021_Commissioning/RF/`

2) **RF ( $\lambda$  vs  $E_n$ ) @ 19.81 m (TC)** → SAMMY (RF2Sammy, F. Gunsing)

3) Calculation with SAMMY with **Final RF (200 bpd  $E_n$ , 0.1 cm bin<sub>L</sub>)** + Data from RF campaign (2500 bpd)

EAR2 RF: Lambda 0.1cm Energy 200BPD at 19.81m from target and RMS 7 ns.

`/eos/experiment/ntof/2021_Commissioning/RF/RF2sammyFolder/EAR2_RF_FLUKAv4.3_all_statistics.root`

# RF @ EAR2: Analysis with SAMMY

- 1) Prepared input files and data files in SAMMY format
- 2) RF ( $\lambda$  vs  $E_n$ )  $\rightarrow$  SAMMY (RF2Sammy, F. Gunsing)

RF WORK DIRECTORY:  
*leos/experiment/ntof/2021\_Commissioning/RF/*

- 3) Calculation with SAMMY with Final RF (200 bpd  $E_n$ , 0.1 cm bin<sub>L</sub>) + Data from RF campaign (2500 bpd)

- 4) **Adjust with SAMMY  $L_0$ :**
  - a)  $L_0$  initial (used for t2e) = 19.51 m
  - b)  $L_0$  fitted with SAMMY

Adjusted  $L_0$  : 19.484 eV

Need to fit down to mm!

# RF @ EAR2: Analysis with SAMMY

- 1) Prepared input files and data files in SAMMY format
- 2) RF ( $\lambda$  vs  $E_n$ )  $\rightarrow$  SAMMY (RF2Sammy, F. Gunsing)
- 3) Calculation with SAMMY with Final RF (200 bpd  $E_n$ , 0.1 cm bin\_L) + Data from RF campaign (2500 bpd)
- 4) Adjust with SAMMY  $L_0$ :
  - a)  $L_0$  initial (used for t2e) = 19.51 m
  - b)  $L_0$  fitted with SAMMY

RF WORK DIRECTORY:  
/eos/experiment/ntof/2021\_Commissioning/RF/

Adjusted  $L_0$  : 19.484 eV

Initial L0				
19.51				
Min Energy Fit	Max Energy Fit		Factor Lo	Adjusted L0
100.000	1000.000		0.99868	19.484
100.000	600.000	eV	0.99862	19.483
200	600.000		0.99871	19.485

Fitted  $L_0$  value  
agrees within 2mm  
for various ranges

- 5) Redone the t2e calibration with the adjusted  $L_0$
- 6) Check with SAMMY  $\rightarrow$  Multiplicative factor of  $L_0 = 1$ 
  - a) Multiplication factor fitted with SAMMY

Adjusted L0				
19.484				
Min Energy Fit	Max Energy Fit		Factor Lo	Adjusted L0
100.000	1000.000	eV	1.0000	19.484
100.000	600.000		1.0000	19.483
200	600.000		1.0000	19.485

# RF @ EAR2: Impact of the RF in SAMMY

<sup>197</sup>Au (n,g): SAMMY **with** vs **without** RF compared to the experimental data ( $L_0$  adjusted = 19.484 m)

**Impact of the RF:**

- Broadening
- Shifting energy

**SAMMY recompiled to avoid shifting the RF to lambda mean = 0**

comment line 265 of sammy/src/udr/mudr3.f  
 $Udt\_E(J,Nud) = Udt\_E(J,Nud) - Ct$

# RF @ EAR2: Validation with SAMMY

$^{197}\text{Au} (n,g)$ : yield normalized between 100 and 250 eV,  $L_0 = 19.484\text{m}$  (adjusted), RF not shifted by SAMMY

# RF @ EAR2: Validation with SAMMY

$^{197}\text{Au}$  (n,g): yield normalized between 100 and 250 eV,  $L_0 = 19.484\text{m}$  (adjusted), RF not shifted by SAMMY

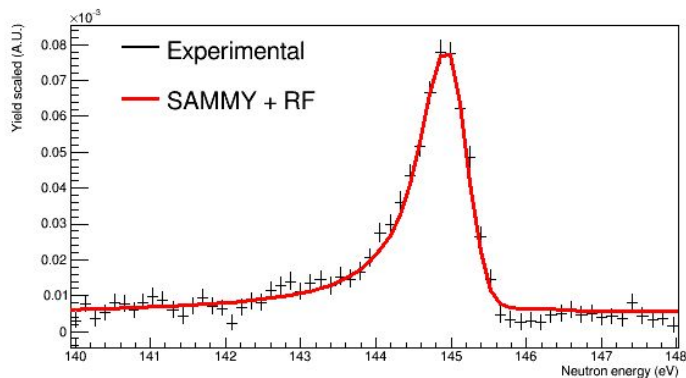

# RF @ EAR2: Validation with SAMMY

$^{238}\text{U}$  (n,g): yield normalized between 5 and 100 eV,  $L_0 = 19.484\text{m}$  (adjusted with Au), RF not shifted by SAMMY

$^{238}\text{U}$  (n,g): yield normalized between 5 and 100 eV,  $L_0 = 19.484\text{m}$  (adjusted with Au), RF not shifted by SAMMY

## Validation with $^{197}\text{Au}(n,g)$ and $^{238}\text{U}(n,g)$ up to 600 eV:

- Energy shift of resonances is **fairly** reproduced → Deviation SAMMY+RF vs experiment equivalent to  **$\Delta L \sim \text{mm}$**
- Shape of the resonance tails (RF) good reproduced.
- In large resonances and at higher energies → overestimation of peak counts in the calculation
  - RF does reproduce the shape?
  - Non-corrected dead time? → **Check & correct with STED data  $^{79}\text{Se}$  campaign (parasitic bunches) (2022)**

- **Summary:**

- Data from few eV up to several tenths of keV. Data quality improved in 2022 with a new measurement of Fe-nat with STEDs.
- FLUKA simulations + Transport → Adjusting the flightpath to extract the RF @ sample position → 19.81 m
- Final RF of EAR2 with full statistics is now available.
- First validation with SAMMY:  $L_0 = 19.48$  m adjusted in the energy range 1-200 eV
- Results for  $^{197}\text{Au}$  and  $^{\text{nat}}$ : good/fair agreement in the shape up to 500 eV but energy shift is not fully reproduced.

- **Next steps:**

- Understand the small deviation in the resonance energy after adjusting  $L_0$  → RF or methodology with SAMMY?
- Complete the validation with  $^{\text{nat}}\text{Ir}$ ,  $^{77}\text{Se}$  and  $^{\text{nat}}\text{Fe}$ : narrow and isolated resonances <10eV and > 1keV.
- Check if experimental effects such as **dead time** can have an influence to reproduce shape around the maximum. The data of STEDs of 2022 & parasitic bunches will be useful for this purpose.
- Calculate the RF for different small misalignments and check the possible impact in the agreement.

THANK YOU FOR  
YOUR ATTENTION!
