

Dark matter from dark photons: from Snowmass to the EOSC

université
PARIS-SACLAY

LUNDS
UNIVERSITET

Snowmass

[...] an opportunity for the entire particle physics community to come together to identify and document a scientific vision for the future of particle physics in the U.S and its international partners. [...]

Goal of this Erasmus+ project

- 1) Make plots that:
 - Highlight the complementary sensitivity to DM masses from colliders and accelerators
 - Show the need for new experiments / colliders that could lead to future discovery
- 2) Make a start to implement the software used for these plots in the ESCAPE Virtual Research Environment

Erasmus+

How do we get to this plot ?

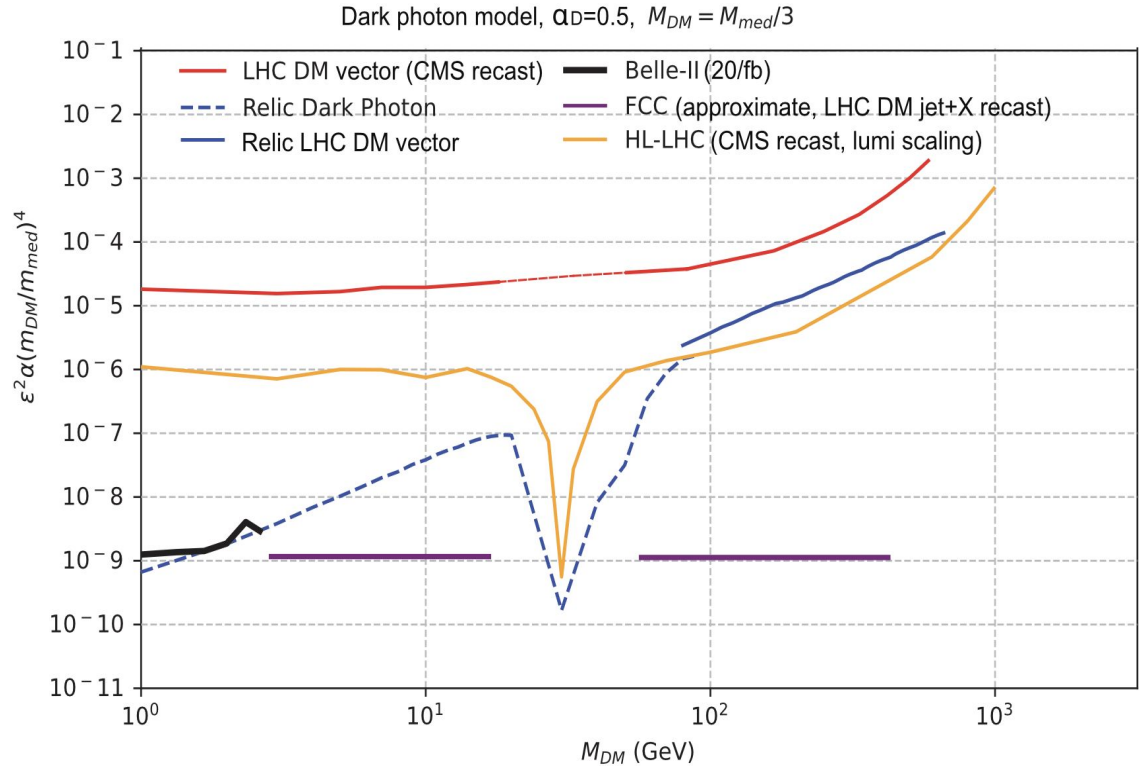

- Projections from collider search
- Monte Carlo generator for signal events (MadGraph5)
- Fast detector simulation (Delphes)
- Analysis software (MadAnalysis)
- All put in a CERN SWAN Jupyter Notebook

More details about this plot

$$y = \varepsilon^2 \alpha (m_{DM}/m_{MED})^4$$

$$\alpha_{DM} = \frac{g_{DM}^2}{4\pi}$$

What are the next steps?

- Put the data and software as is on the Virtual Research Environment
 - Discuss on how to put the software packages natively on the software catalogue
- Hopefully, discover DM in the next 10 years!

Thank you for your attention :)
