Established by the European Commission

Two Pictures of the Nucleus

Two ways to describe nuclei

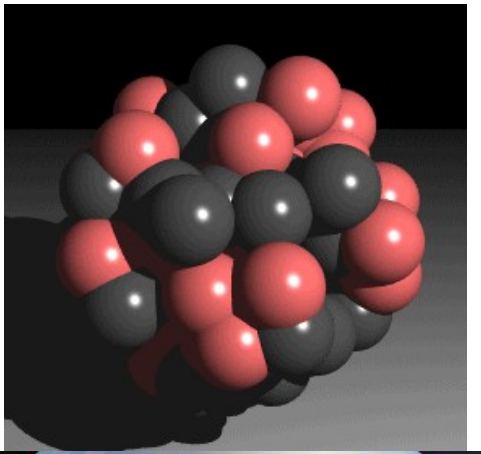
- As an ensemble of nucleons
- As an ensemble of quarks and gluons

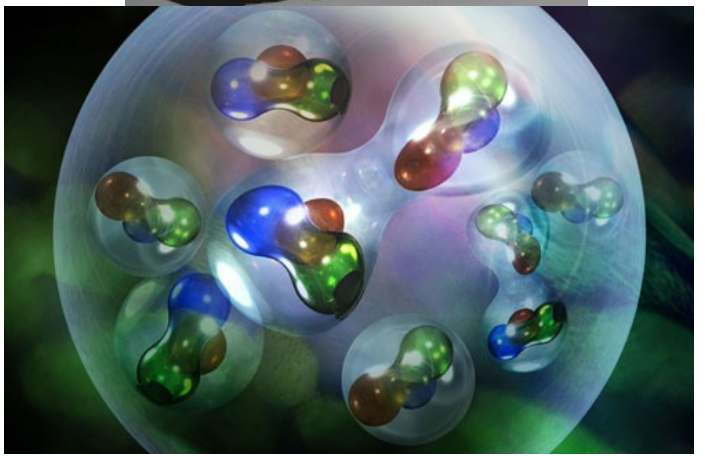
Traditional nuclear physics

- This picture is very effective
- Nuclear properties well reproduced
- Needs good NN and NNN forces
- Sometimes effective forces

Do we need to go beyond

- If we have major issues to resolve

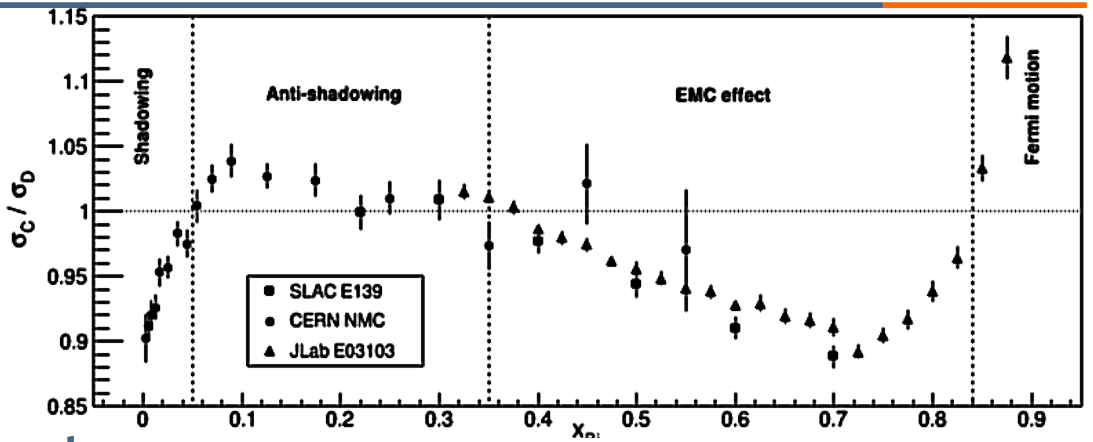


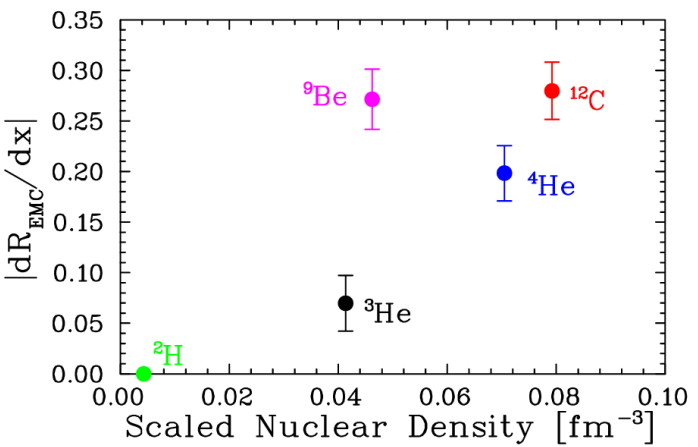


The Nucleus Quark Structure

The nuclear PDFs show many suprises

- Quarks are affected by the nuclear medium
- The EMC effect at large x, the shadowing effect at lower x
- The dependence of this effect appears to have complexe dependence to nuclear density





Measuring Nuclear DVCS

Nuclei give control over the spin

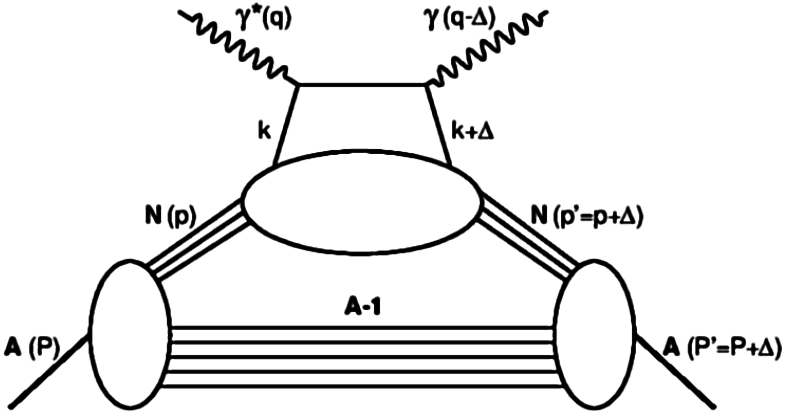
- Spin-0 → 2 GPD ; Spin-1/2 → 8 GPDs ; Spin-1 → 18 GPDs
- Half of these intervene in DVCS

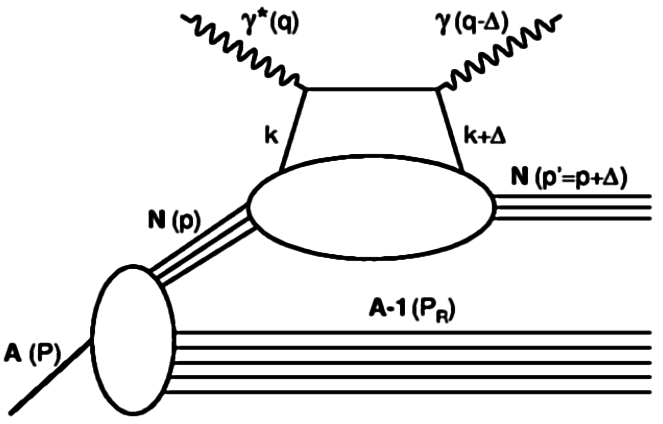
In the nucleus two processes

- Coherent and incoherent channels
  - **Similar to elastic and quasi-elastic**
- Probe the whole nucleus and the bound nucleons

A perfect tool to study the EMC effect

- Coherent DVCS gives access to the full nucleus
  - **Including non-nucleonic degrees of freedom**
- Incoherent DVCS gives access to the bound nucleon
  - **To test modifications of the bound nucleon structure**





R. Dupré and S. Scopetta. 3D Structure and Nuclear Targets. Eur. Phys. J., A52(6):159, 2016

HERMES Results

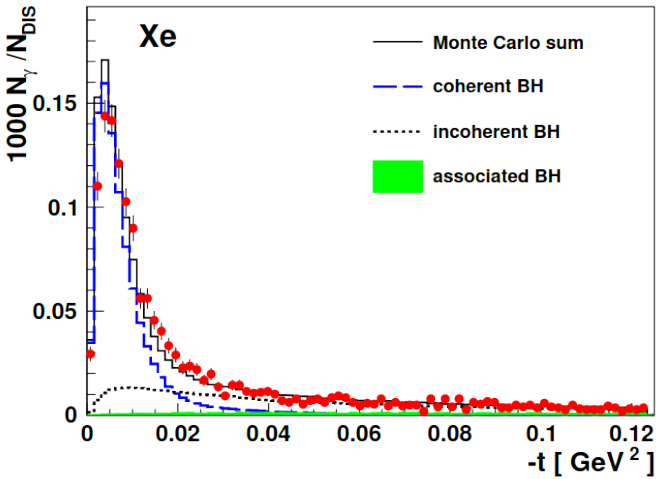
Nuclear DVCS measurement by HERMES

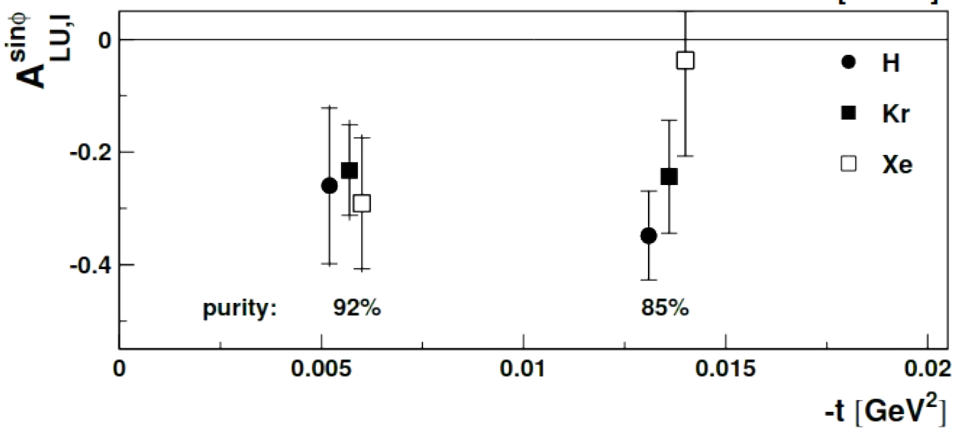
- Charge and beam-spin asymmetries
- No clear nuclear dependence
- In a rather pure coherent sample

This is a problem…

- In the coherent process we expect a significant increase
- Argument about the way coherent and incoherent are separated

Can we measure it directly ?





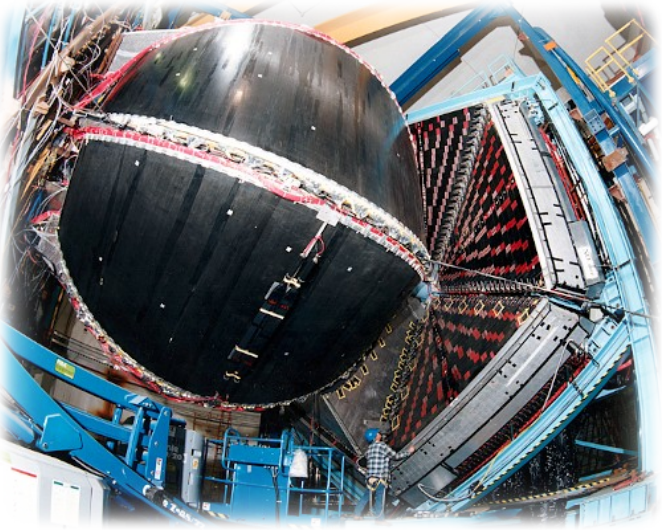
The CLAS experiment at JLab

Jefferson Laboratory

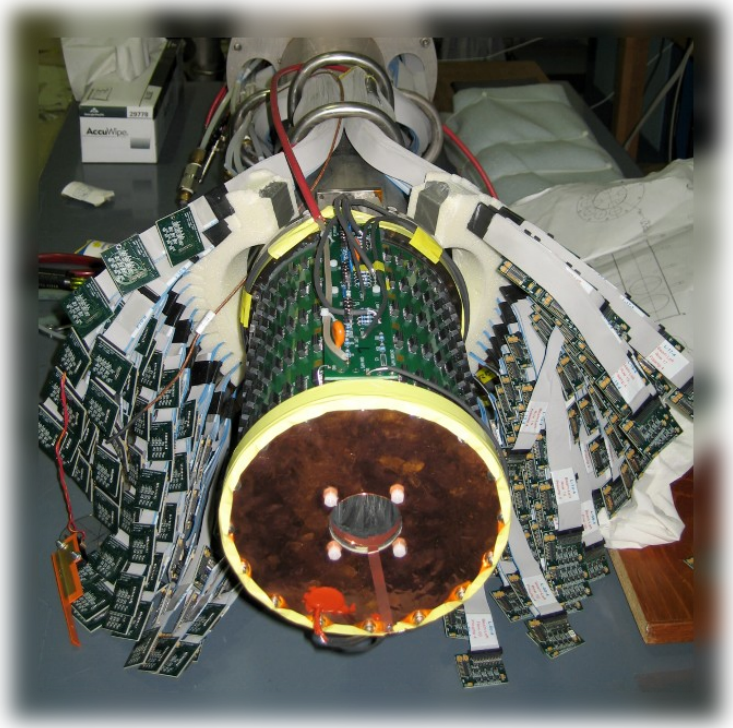
- 6 GeV electron beam (now 12 GeV)
- High stability, 100 % duty factor

The CLAS spectrometer

- 2π acceptance
- Luminosity ~10^{34} $cm^{-2}s^{-1}$
- Upgraded for DVCS measurements
  - **A Low angle calorimeter for photons**
  - **A Solenoid to protect it from secondaries**



Detecting Recoil Nuclei



Recoil nuclei are evasive

- They usually do not make it out of the target…

How to handle that ?

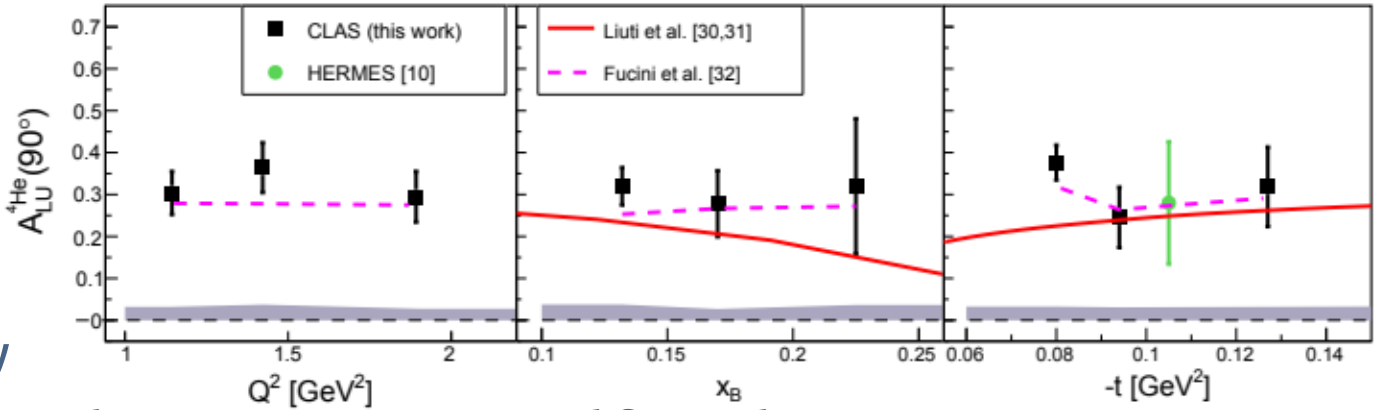
- Use a light nuclei : Helium
  - **It is also spin-0 which is nice for simplicity**
- Use a light target : a straw
  - **Filled at 5 Atm with 50 µm thick walls**
- Get very close to it : Radial TPC
  - **3 cm away from the target**

The experiment ran in 2009

The Coherent Helium DVCS

Coherent DVCS on helium

- Fully exclusive
- We observed large beam spin asymmetry
  - **About twice the one on the proton, as expected from theory**

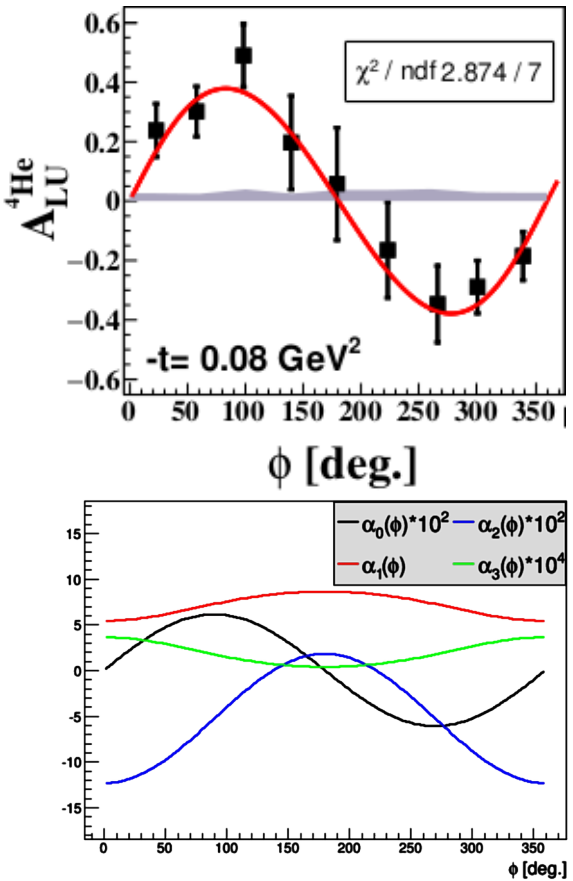


Interpretation of the results

- This strong signal shows we fully isolated coherent DVCS
- The amount of data is too little for advanced interpretation
- But enough to check if we can extract the CFF !

M. Hattawy et al. (CLAS Coll.) Phys. Rev. Lett., 119(20):202004, 2017.

Nuclear CFF Extraction



The Helium CFF extraction

- Simplified by the spin-0 (1 GPD/CFF)

This is done using the different contributions in phi

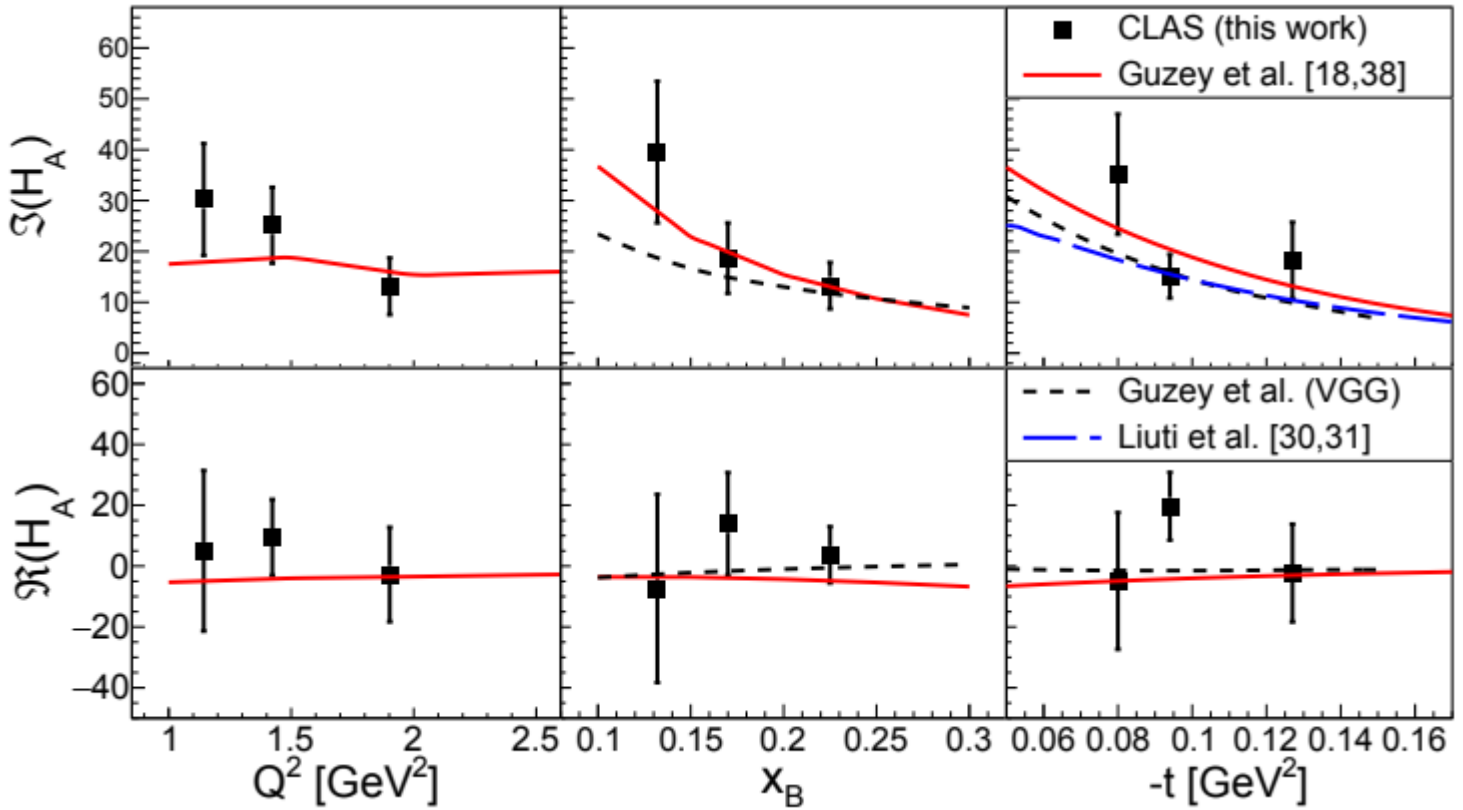
- They are calculable within pQCD

$$A_{LU}(\phi) = \frac{\alpha_0(\phi)\,\Im m(\mathcal{H}_A)}{\alpha_1(\phi) + \alpha_2(\phi)\,\Re e(\mathcal{H}_A) + \alpha_3(\phi)\left(\Re e(\mathcal{H}_A)^2 + \Im m(\mathcal{H}_A)^2\right)}$$

- The fit converges immediately

M. Hattawy et al. (CLAS Coll.) Phys. Rev. Lett., 119(20):202004, 2017.

(First) Model independent CFF extraction



Incoherent Helium DVCS

Gives a "generalized" EMC

- Strongly suppressed in particular for anti-shadowing
- Strange behavior compared to the models

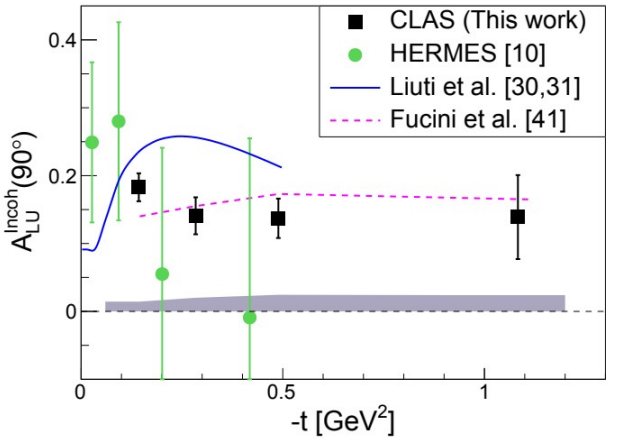
A New kind of EMC effect?

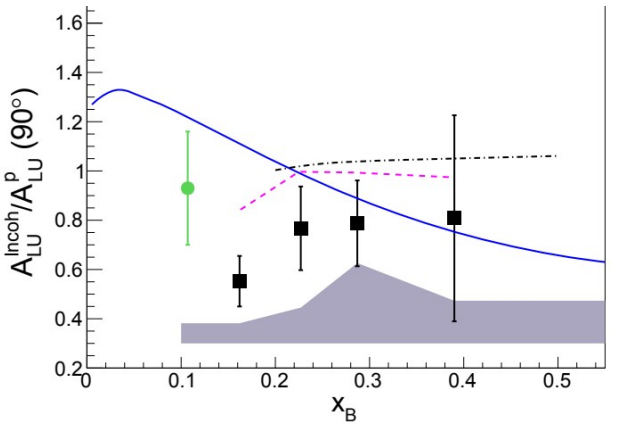
- It could be a nuclear effect
- Or it could be due to final state interactions
  - **Can be very complicated in DVCS**

M. Hattawy et al. (CLAS Coll.) Phys. Rev. Lett., 123(3):032502, 2019.

More work is ongoing on these questions

- On the theoretical side for a better description
- On the experimental side with nitrogen data





The ALERT Detector

A Low Energy Recoil Tracker

- Hyperbolic drift chamber
- Time-of-Flight array

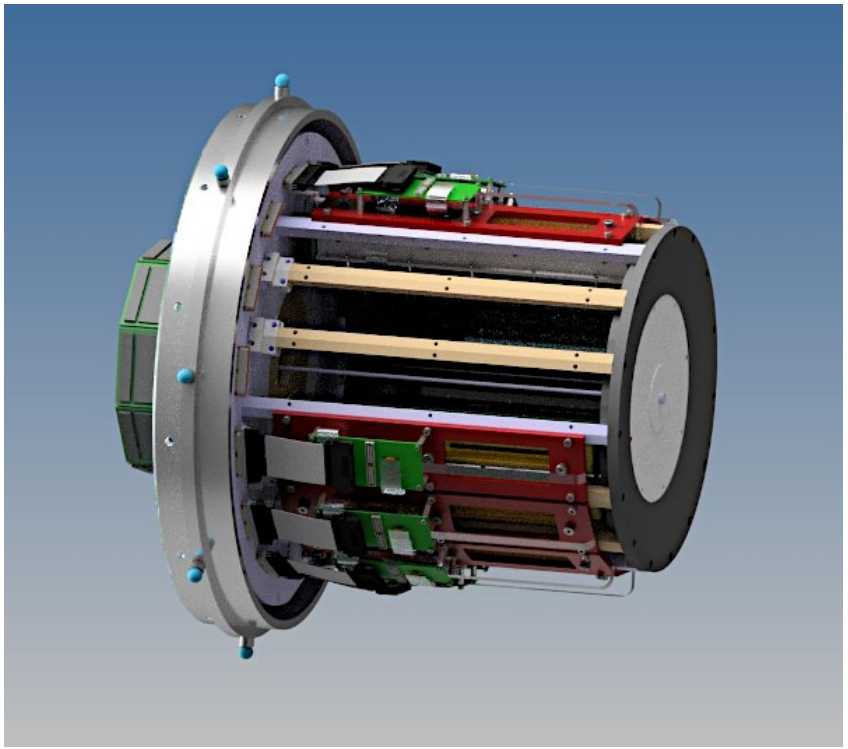
It will be used for a large array of experiments

- Nuclear DVCS, DVMP...
- Tagged processes (detailed later)

Collaborative effort within CLAS12

- ANL, IJCLab, JLab, NMSU, and Temple
- We tested a prototype with a nuclear beam in the Fall at the ALTO facility (Orsay, France)

We hope to take data in 2023 or 2024



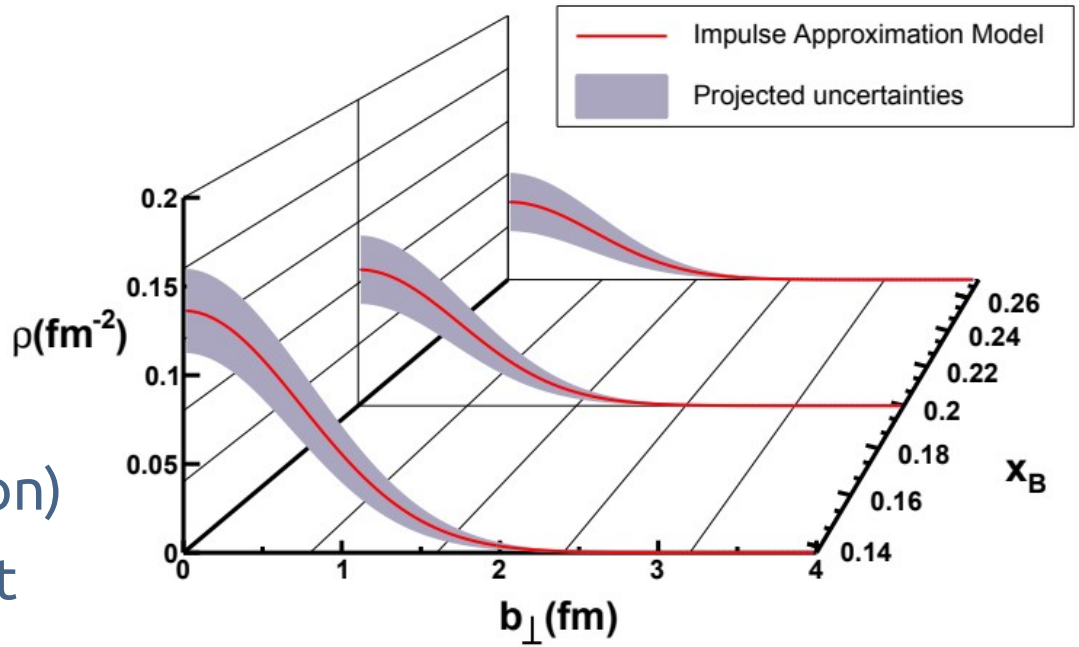
What results do we expect ?

Tomography of a nucleus

- A view into the nucleus in three dimensions
- Using the wider phase space and larger statistics

Extension to the gluons

- We will measure DVMP (Phi meson)
- We hope to obtain a similar result for gluon tomography



Tagging to Access Offshellness

Tagging connects EMC to nucleon kinematics

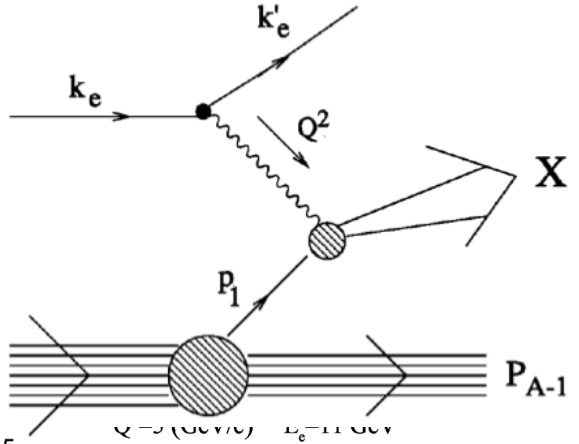
- Linked through virtuality of the nucleon
- Can differentiate mean field from SRC nucleons

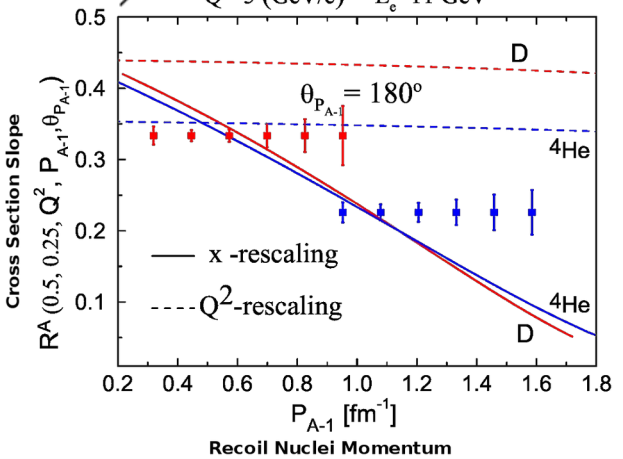
This will test models and more

- Comparison between deuterium and helium
- It unequivocally resolve the link between the EMC effect and nucleon momentum

Different nuclei

- Cover different momentum ranges
- Mean field vs SRC





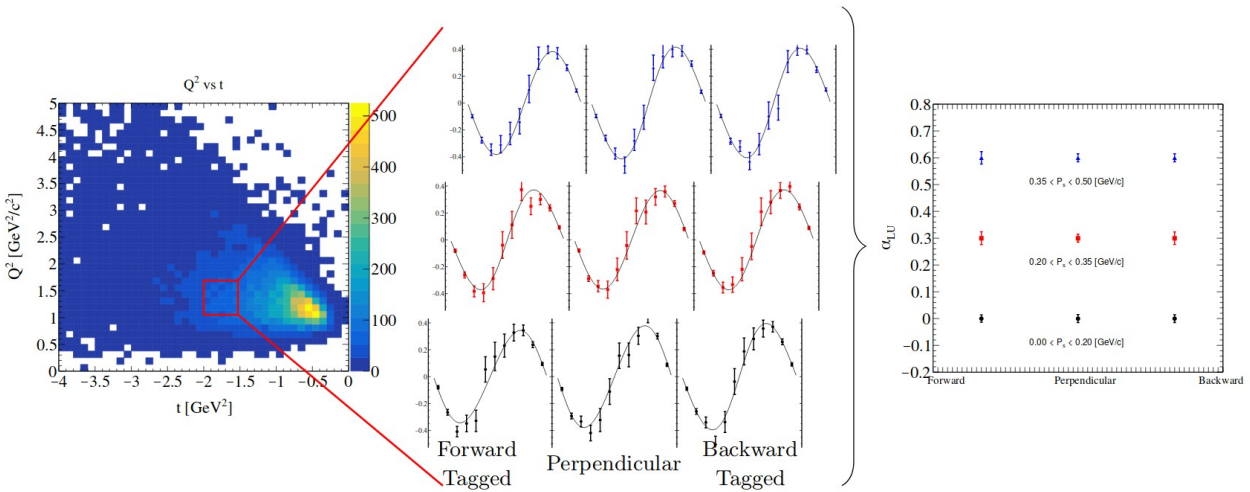
Understanding the Incoherent DVCS

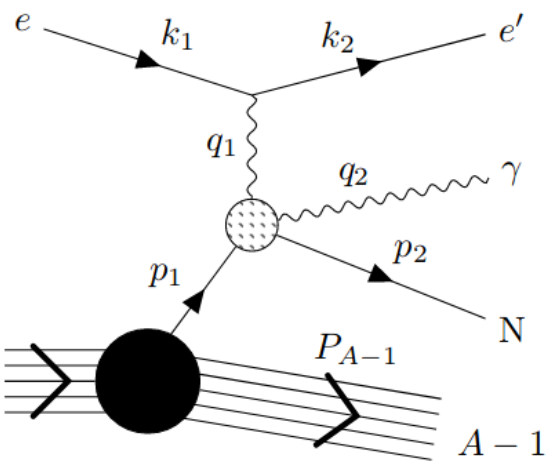
Tagging the incoherent DVCS

- A tagged measurement can pin down the origin of the strong BSA suppression in incoherent DVCS
- By better controling the initial and final states independently

Proposed for JLab 12 GeV

- This is probably an important addition for all incoherent processes in the future





Summary

We do not understand the nucleus well within QCD

- Either we do not understand the mechanisms at play
- Or we lack a quantitative calculation to demonstrate it

There is hope in nuclear GPDs

- We measured coherent and incoherent nuclear DVCS
  - **Confirming some of our understanding and raising new questions at once**
- More measurements are coming to reach high precision

Two important new elements are coming

- Using tagging will constrain the theoretical models
