3D Partons Week
Discussion session

Valerio Bertone, Cédric Mezrag,
Hervé Moutarde, Pawel Sznajder and Jakub Wagner

October $26^{th} - 28^{th}$ 2022

- Thank you very much for your participation !

- Thank you very much for your participation !
- We had presentations and discussions of very high quality covering all topics:

- Thank you very much for your participation !
- We had presentations and discussions of very high quality covering all topics:
  - ▶ Present and future experimental facilities allowing extractions of GPDs
  - ▶ Precision leap in already known processes (NNLO and HT)
  - ▶ New processes sensitive to GPDs
  - ▶ New extractions and uncertainty assessments
  - ▶ Nuclear targets, Lattice QCD,...

  - ▶ Precision leap in already known processes (NNLO and HT)
  - ▶ New processes sensitive to GPDs
  - ▶ New extractions and uncertainty assessments
  - ▶ Nuclear targets, Lattice QCD,...
- Are there questions in the audience (on a given presentation or more generally) ?

List of Questions (non exhaustive)

- **Experiments:** What would be the most valuable for us, positron at JLab or JLab 20+ ? More generally, on which observables shoud we focus ?

List of Questions (non exhaustive)

- **Experiments:** What would be the most valuable for us, positron at JLab or JLab 20+ ? More generally, on which observables shoud we focus ?

- **pQCD:** We are on the verge of "theory precision era" with NNLO correction for DVCS (important for EIC) and resummed kinematical higher-twist contributions (important for JLab). What should we expect regarding EIC? Do we need both NNLO and HT ?

- **pQCD:** We are on the verge of "theory precision era" with NNLO correction for DVCS (important for EIC) and resummed kinematical higher-twist contributions (important for JLab). What should we expect regarding EIC? Do we need both NNLO and HT ?

- **Small x_B:** In the perspective of UPC and EIC, the question of small x_B exclusive processes deserved to be asked. It remains unclear what should be done with logs (fixed scales? Resummed?)

- **Small x_B:** In the perspective of UPC and EIC, the question of small x_B exclusive processes deserved to be asked. It remains unclear what should be done with logs (fixed scales? Resummed?)

- **Modelling GPDs and assessing uncertainties:** Replica method provides a statistical envelop, at the cost of having oscillating functions. Can we go beyond that ?

- **Modelling GPDs and assessing uncertainties:** Replica method provides a statistical envelop, at the cost of having oscillating functions. Can we go beyond that ?

- **Multi-channel fits:** How to do it consistently ? (pQCD orders, renormalisation schemes, resummation , etc...)

Thank you again
and have a nice trip back home
